HLMP-Q102/Q152/Q106/Q156

Subminiature High-Performance Red LED Lamps

Description

Flat Top Package

The Broadcom[®] HLMP-Pxxx Series flat-top lamps use an untinted, non-diffused, truncated lens to provide a wide radiation pattern that is necessary for use in backlighting applications. The flat-top lamps are also ideal for use as emitters in light pipe applications.

Dome Packages

The HLMP-Qxxx Series dome lamps, for use as indicators, use a tinted, diffused lens to provide a wide viewing angle with high on-off contrast ratio. High-brightness lamps use an untinted, nondiffused lens to provide a high luminous intensity within a narrow radiation pattern.

Lead Configurations

All of these devices are made by encapsulating LED chips on axial lead frames to form molded epoxy subminiature lamp packages. A variety of package configuration options are available. These include special surface-mount lead configurations, gull wing, yoke lead, or Z-bend. Right-angle lead bends at 2.54 mm (0.100 in.) and 5.08 mm (0.200 in.) center spacing are available for through-hole mounting. For additional information, refer to the *Standard SMT and Through-Hole Lead Bend Options for Subminiature LED Lamps Data Sheet*.

Features

- Subminiature flat-top package
- Ideal for backlighting and light piping applications
- Subminiature dome package
 - Diffused dome for wide viewing angle
 - Non-diffused dome for high brightness
- Wide range of drive currents 500 mA to 50 mA
- Ideal for space-limited applications
- Axial leads
- Available with lead configurations for surface-mount and through-hole PC board mounting

- a. Derate linearly as shown in [Figure 6](#).
- b. See [Figure 7](#) to establish pulsed operating conditions.
- c. Maximum IAVG at $f = 1 \text{ kHz}$, $DF = 10\%$.
- d. The transient peak current is the maximum non-recurring peak current the device can withstand without damaging the LED die and wire bonds. It is not recommended that the device be operated at peak currents above the Absolute Maximum Peak Forward Current.
- e. 120 mW for HLMP-P156-HK0xx and HLMP-Q106-VX0xx.

- The luminous intensity, I_v , is measured at the mechanical axis of the lamp package. The actual peak of the spatial radiation pattern may not be aligned with this axis.
- ϕ_v is the total luminous flux output as measured with an integrating sphere.
- The dominant wavelength, λ_d , is derived from the CIE Chromaticity Diagram and represents the color of the device.
- $\theta^{1/2}$ is the off-axis angle where the luminous intensity is 1/2 the peak intensity.
- Radiant intensity, I_r , in watts/steradian, may be calculated from the equation $I_r = I_v/\eta_v$, where I_v is the luminous intensity in candelas and η_v is the luminous efficacy in lumens/watt.
