Mode of Operation

Connected with the 3 phases (and neutral) DPB02 and PPB02 operate when all 3 phases are present at the same time, the phase sequence is correct and the asymmetry is under the set level.

Asymmetry is defined as follows:

> $max{|\Delta V_{ph-ph}|}$ nom. voltage

measuring phasewhen phase voltages and also as follows:

 $max\{|\Delta V_{ph\text{-}n}|\}$ nom. voltage

when measuring phase-neutral voltages.

If the asymmetry exceeds the set level the red LED starts flashing 2 Hz and the output relay releases after the set time period. If the phase sequence is incorrect or one phase is lost, the output relay releases immediately. Only 200 ms delay occurs. The failure is indicated by the

red LED flashing 5 Hz after the alarm condition occurs. Example 1 (mains network monitoring)

General Specifications

The relay monitors asymmetry, phase loss and correct phase sequence.

Example 2 (load monitoring)

The relay releases in case of interruption of one or more phases or when the asymmetry exceeds the set level.
