## Mode of Operation

Connected to the 3 phases (and neutral) DPB71 operates when all 3 phases are present at the same time, the phase sequence is correct and the phase-phase (or phase-neutral) voltage levels are within set limits.

If one or more phase-phase or phase-neutral voltages exceeds the upper set level

or drops below the lower set level, the red LED starts flashing 2 Hz and the output relay releases after the set time period. If the phase sequence is wrong or one phase is lost, the output relay releases immediately. Only 200 ms delay occurs. The failure is indicated by the red LED flashing 5 Hz during the alarm condition.

### Example 1

(mains network monitoring)  
The relay monitors over and under voltage, phase loss and correct phase sequence.

### Example 2

(load monitoring)  
The relay releases in case of interruption of one or more phases, when one or more voltages drop below the lower set level or exceed the upper set level.

## Function/Range/Level and Time Delay Setting

Adjust the input range setting the DIP switches 3 and 4 as shown below. Select the desired function setting the DIP switches 1 and 2 as shown below. To access the DIP switches open the grey plastic cover

as shown below.

### Selection of level and time delay:

**Upper knob:** Setting of lower level on relative scale.  
**Lower knob:** Setting of delay on alarm time on absolute scale (0.1 to 30 s).

### Centre knob:

Setting of upper level on relative scale.

### Power ON delay
