

## CA-IS373x High-Speed Triple-Channel Digital Isolators

### 1. Key Features

- Signal Rate: DC to 150Mbps
- Wide Operating Supply Voltage: 2.5V to 5.5V
- Wide Operating Temperature Range: -40°C to 125°C
- No Start-Up Initialization Required
- Default Output High and Low Options
- High Electromagnetic Immunity
- High CMTI:  $\pm 100\text{kV}/\mu\text{s}$  (Typical)
- Low Power Consumption (Typical):
  - 1.5mA per Channel at 1Mbps with 3.3V Supply
  - 5.5mA per Channel at 100Mbps with 3.3V Supply
- Precise Timing (Typical)
  - 8ns Propagation Delay
  - 1ns Pulse Width Distortion
  - 2ns Propagation Delay Skew
  - 5ns Minimum Pulse Width
- Isolation Rating up to 5kVrms
- Isolation Barrier Life: >40 Years at Rated Working Voltage
- Tri-state Outputs with ENABLE
- Schmitt Trigger Inputs
- RoHS-Compliant Packages
  - SOIC-16 Narrow Body
  - SOIC-16 Wide Body

### 2. Applications

- Industrial Automation Systems
- Motor Control
- Medical Electronics
- Isolated Switch Mode Supplies
- Solar Inverters
- Isolated ADC, DAC

### 3. Description

The CA-IS373x devices are high-performance triple-channel digital isolators with precise timing characteristics and low power consumption. The CA-IS373x devices provide high electromagnetic immunity and low emissions, while isolating CMOS digital I/Os. All device versions have Schmitt trigger input for high noise immunity. Each isolation channel consists of a transmitter and a receiver separated by silicon

dioxide ( $\text{SiO}_2$ ) insulation barrier. The CA-IS3730 device has all three channels in the same direction with output enable on output side, the CA-IS3731 device has two forward and one reverse-direction channels with output enable on both sides, and the CA-IS3735 device has the same channel configuration as CA-IS3730 without output enable. All devices have fail-safe mode option. If the input power or signal is lost, default output is low for devices with suffix L and high for devices with suffix H.

CA-IS373x devices has high insulation capability to handle noise and surge on a data bus or other circuits from entering the local ground and interfering with or damaging sensitive circuitry. High CMTI ability promises the correct transmission of digital signal. The CA-IS373x devices are available in 16-pin narrow body SOIC and 16-pin wide body SOIC packages. All products have > 2.5kVrms isolation rating, and products in wide-body packages support insulation withstanding up to 5kVrms.

#### Device Information

PART NUMBER	PACKAGE	BODY SIZE(NOM)
CA-IS3730, CA-IS3731, CA-IS3735	SOIC16-NB (N)	9.90 mm × 3.90 mm
	SOIC16-WB(W)	10.30 mm × 7.50 mm

#### Simplified Channel Structure

Channel A side and B side are separated by isolation capacitors. GNDA and GNDB are the isolated ground for signals and supplies of A side and B side respectively.

## 7. Specifications

### 7.1. Absolute Maximum Ratings<sup>1</sup>

		MIN	MAX	UNIT
$V_{DDA}, V_{DDB}$	Supply Voltage <sup>2</sup>	-0.5	6.0	V
$V_{in}$	Voltage at Ax, Bx, ENx	-0.5	$V_{DDA}+0.5^3$	V
$I_O$	Output Current	15	15	mA
$T_j$	Junction Temperature		150	°C
$T_{STG}$	Storage Temperature	-65	150	°C

**NOTE:**

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GNDA or GNDB) and are peak voltage values.
- Maximum voltage must not exceed 6 V.

### 7.2. ESD Ratings

		VALUE	UNIT
$V_{ESD}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>1</sup>	2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>2</sup>	200	

**NOTE:**

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 8. Parameter Measurement Information

**NOTE:**

1. A square wave generator generate the  $V_{IN}$  input signal with the following constraints: waveform frequency  $\leq 100\text{kHz}$ , 50% duty cycle,  $t_r \leq 3\text{ns}$ ,  $t_f \leq 3\text{ns}$ . Since the waveform generator has an output impedance of  $Z_{out} = 50\Omega$ , the  $50\Omega$  resistor in the figure is used for matching. There is no need in the actual application.
2.  $C_L$  is the load capacitance about 15pF together with the instrumentation capacitance. Since the load capacitance influence the output rising time, it's a key factor in the timing characteristic measurement.

**NOTE:**

1. The High Voltage Surge Generator generates repetitive high voltage surges with > 1kV amplitude and <10ns rise time and fall time to reach common-mode transient noise with > 100kV/ $\mu$ s slew rate.
2.  $C_L$  is the load capacitance about 15pF together with the instrumentation capacitance.
3. Pass-fail criteria: The output must remain stable whenever the high voltage surges come.
4.  $C_{BP}$  is the 0.1 ~ 1uF bypass capacitance.

## 9. Detailed Description

### 9.1. Theory of Operation

The CA-IS373x family of devices use a simple ON-OFF keying (OOK) modulation scheme to transmit signal across the SiO<sub>2</sub> isolation capacitors that provide a robust insulation between two different voltage domain and act as a high frequency signal path between the input and the output. The transmitter (TX) modulates the input signal onto the carrier frequency, that is, TX delivers high frequency signal across the isolation barrier in one input state and delivers no signal across the barrier in the other input state. Then the receiver rebuilds the input signal according to the detected in-band energy. If the ENx pin is low then the output goes to high impedance state and will be pulled up to V<sub>DDO</sub> (CA-IS373xH) or pull down to the corresponding GND (CA-IS373xL). This simple architecture offers a robust isolated data path and requires no special considerations or initialization at start-up. The capacitor-based signal path is fully differential to maximize noise immunity, which is also known as common-mode transient immunity. Advanced circuitry techniques are applied for better EMI introduced by the carrier signal and IO switching. The capacitively-coupled architecture provides much higher electromagnetic immunity compared to the inductively-coupled one. And OOK modulation scheme eliminates the missing-pulse error that occurs in the pulse modulation method. A simplified functional block diagram and conceptual operation waveforms of a single channel is shown in Figure 9-1 and Figure 9-2.

**9.3. Device Operation Modes**

Table 9-1 provides the operation modes for the CA-IS373x devices.

**Table 9-1 Operation Mode Table<sup>1</sup>**

V <sub>DDI</sub>	V <sub>DDO</sub>	INPUT(A <sub>x</sub> /B <sub>x</sub> ) <sup>2</sup>	OUTPUT ENABLE(EN <sub>x</sub> ) <sup>3,4</sup>	OUTPUT (A <sub>x</sub> /B <sub>x</sub> )	OPERATION
PU	PU	H	H or Open	H	Normal operation mode: A channel's output follows the input state
		L	H or Open	L	
		Open	H or Open	Default	Default output fail-safe mode: If a channel's input is left open, its output goes to the default value (Low for CA-IS373xL and High for CA-IS373xH).
X	PU	X	L	Z	High impedance mode: If Enable pin is tied to low, the output will be in high-Z mode
PD	PU	X	H or Open	Default	Default output fail-safe mode: If the input side V <sub>DD</sub> is unpowered, the outputs go in to the default output fail-safe mode (Low for CA-IS373xL and High for CA-IS373xH)
X	PD	X	X	Undetermined	If the output side V <sub>DD</sub> is unpowered, the outputs' states are undetermined. <sup>5</sup>

**NOTE:**

- V<sub>DDI</sub> = Input-side V<sub>DD</sub>; V<sub>DDO</sub> = Output-side V<sub>DD</sub>; PU = Powered up (VCC ≥ 2.375 V); PD = Powered down (VCC ≤ 2.25 V); X = Irrelevant; H = High level; L = Low level; Z = High Impedance.
- A strongly driven input signal can weakly power the floating V<sub>DD</sub> through an internal protection diode and cause undetermined output.
- It is recommended that the enable inputs be connected to an external logic high or low level when the CA-IS373x is operating in noisy environments.
- No Connect (NC) replaces ENA on CA-IS3730/45. No Connect replaces EN2 on the CA-IS3735. No Connects are not internally connected and can be left floating, tied to V<sub>DD</sub>, or tied to GND.
- The outputs are in undetermined state when 2.25V < V<sub>DDI</sub>, V<sub>DDO</sub> < 2.375 V.

Table 9-2 provides the Enable input truth table for the CA-IS373x devices.

**Table 9-2 Enable Input Truth Table**

PART NUMBER	ENA <sup>1,2</sup>	ENB <sup>1,2</sup>	OPERATION
CA-IS3730	—	H	Outputs B1, B2, B3, B4 are enabled and follow the input state.
	—	L	Outputs B1, B2, B3, B4 are disabled and in high impedance state.
CA-IS3731	H	X	Output A4 enabled and follows the input state.
	L	X	Output A4 disabled and in high impedance state.
	X	H	Outputs B1, B2, B3 are enabled and follow the input state.
	X	L	Outputs B1, B2, B3 are disabled and in high impedance state.
CA-IS3735	—	—	Outputs B1, B2, B3, B4 are enabled and follow the input state.

**NOTE:**

- Enable inputs ENA and ENB can be used for multiplexing, for clock sync, or other output control. ENA, ENB logic operation is summarized for each isolator product in Table 9-2. These inputs are internally pulled-up to local V<sub>DD</sub> allowing them to be connected to an external logic level (high or low) or left floating. To minimize noise coupling, do not connect circuit traces to ENA or ENB if they are left floating. If ENA, ENB are unused, it is recommended they be connected to an external logic level, especially if the CA-IS373x is operating in a noisy environment.
- X = Irrelevant; H = High level; L = Low level.

## 10. Application and Implementation

Unlike optocouplers, which need external components to improve performance, provide bias, or limit current, the CA-IS373x family device CMOS digital isolator needs only two external VDD bypass capacitors (0.1μF to 1 μF) to operate. Its TTL level compatible input terminals draw only micro amps of leakage current, allowing them to be driven without external buffering circuits. The output terminals have a characteristic impedance of 50 Ω (rail-to-rail swing) and are available in both forward and reverse channel configurations. Figure 10-1 shows the typical application of CA-IS3731 device. And the circuit of Figure 10-2 is typical for most applications of CA-IS37xx series products and is as easy to use as a standard logic gate.
