

Features

- Single-Supply Operation from +1.8V ~ +6V
- Rail-to-Rail Input / Output
- Gain-Bandwidth Product: 1MHz (Typ.)
- Low Input Bias Current: 1pA (Typ.)
- Low Offset Voltage: 3.5mV (Max.)
- Quiescent Current: 75μA per Amplifier (Typ.)
- Embedded RF Anti-EMI Filter
- Operating Temperature: -40°C ~ +125°C
- Small Package:
 CBM6001 Available in SOT23-5 and
 SC70-5 Packages
 CBM6002 Available in SOP-8 and MSOP-8
 Packages
 CBM6004 Available in SOP-14 and
 TSSOP-14 Packages

Application

- ASIC Input or Output Amplifier
- Sensor Interface
- Medical Communication
- Smoke Detectors
- Audio Output
- Piezoelectric Transducer Amplifier
- Medical Instrumentation
- Portable Systems

Description

The CBM6001 family have a high gain-bandwidth product of 1MHz, a slew rate of 0.8V/µs, and a quiescent current of 75 µA/amplifier at 5V. The CBM6001 family is designed to provide optimal performance in low voltage and low noise systems. They provide rail-to-rail output swing into heavy loads. The input common mode voltage rangeµ includes ground, and the maximuµm input offset voltage is 3.5mV for CBM6001 family. They are specified over the extended industrial temperature range (-40°C +125°C). The operating range is from 1.8V to 6V. The CBM6001 single is available in Green SC70-5 and SOT23-5 packages. The CBM6002 dual is available in Green SOP-8 and MSOP-8 packages. The CBM6004 Quad is available in Green SOP-14°C and TSSO°CP-14 packages.

PIN CONFIGURATION

ABSOLUTE MAXIMUM RATINGS

| Condition | Min | Мах | | | |
|--|-----------------------|-----------------------|--|--|--|
| Power Supply Voltage (V _{DD} to V _{SS}) | -0.5V | +7.5V | | | |
| Analog Input Voltage (IN+ or IN-) | V _{SS} -0.5V | V _{DD} +0.5V | | | |
| PDB Input Voltage | V _{SS} -0.5V | +7V | | | |
| Operating Temperature Range | -45°C | +125℃ | | | |
| Junction Temperature | +16 | 60°C | | | |
| Storage Temperature Range | -55℃ | +150℃ | | | |
| Lead Temperature (soldering, 10sec) | +260°C | | | | |
| Package Thermal Resistance (TA=+25°C) | | | | | |
| SOP-8, θ _{JA} | 125° | °C/W | | | |
| MSOP-8, θ_{JA} | 216 | °C/W | | | |
| SOT23-5, θ _{JA} | 190° | °C/W | | | |
| SC70-5, θ _{JA} | 333°C/W | | | | |
| ESD Susceptibility | | | | | |
| НВМ | 6KV | | | | |
| MM | 400V | | | | |

Note: Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

ELECTRICAL CHARACTERISTICS

At VS = +5V, RL = $100k\Omega$ connected to VS/2, and VOUT = VS/2, unless otherwise noted.

APPLICATION NOTES Sise

CBM6001 family series op amps are unity-gain stable and suitable for a wide range of general-purpose applications. The small footprints of the CBM6001 family packages save space on printed circuit boards and enable the design of smaller electronic products.

Power Supply Bypassing and Board Layout

CBM6001 family series operates from a single 1.8V to 6V supply or dual $\pm 0.9V$ to $\pm 3V$ supplies. For best performance, a $0.1\mu F$ ceramic capacitor should be placed close to the V_{DD} pin in single supply operation. For dual supply operation, both V_{DD} and V_{SS} supplies should be bypassed to ground with separate $0.1\mu F$ ceramic capacitors.

Low Supply Current

The low supply current (typical $75\mu A$ per channel) of CBM6001 family will help to maximize battery life. They are ideal for battery powered systems.

Operating Voltage

CBM6001 family operates under wide input supply voltage (1.8V to 6V). In addition, all temperature specifications apply from -40°C to +125°C. Most behavior remains unchanged throughout the full operating voltage range. These guarantees ensure operation throughout the single Li-Ion battery lifetime.

Rail-to-Rail Input

The input common-mode range of CBM6001 family extends 100mV beyond the supply rails (V_{SS} -0.1V to V_{DD} +0.1V). This is achieved by using complementary input stage. For normal operation, inputs should be limited to this range.

Rail-to-Rail Output

Rail-to-Rail output swing provides maximum possible dynamic range at the output. This is particularly important when operating in low supply voltages. The output voltage of CBM6001 family can typically swing to less than 10mV from supply rail in light resistive loads (>100k Ω), and 60mV of supply rail in moderate resistive loads (10k Ω).

Capacitive Load Tolerance

The CBM6001 family is optimized for bandwidth and speed, not for driving capacitive loads. Output capacitance will create a pole in the amplifier's feedback path, leading to excessive peaking and potential oscillation. If dealing with load capacitance is a requirement of the application, the two strategies to consider are (1) using a small resistor in series with the amplifier's output and the load capacitance and (2) reducing the bandwidth of the amplifier's feedback loop by increasing the overall noise gain. Figure 2 shows a unity gain follower using the series resistor strategy. The resistor isolates the output from the capacitance and, more importantly, creates a zero in the feedback path that compensates for the pole created by the output capacitance.

Figure 2. Indirectly Driving a Capacitive Load Using Isolation Resistor

The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. However, if there is a resistive load RL in parallel with the capacitive load, a voltage divider (proportional to R_{ISO}/RL) is formed, this will result in a gain error.

The circuit in Figure 3 is an improvement to the one in Figure 2. R_F provides the DC accuracy by feed-forward the V_{IN} to R_L . C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving the phase margin in the overall feedback loop. Capacitive drive can be increased by increasing the value of C_F . This in turn will slow down the pulse response.

Figure 3. Indirectly Driving a Capacitive Load with DC Accuracy

Typical Application Circuits

Differential amplifier

The differential amplifier allows the subtraction of two input voltages or cancellation of a signal common the two inputs. It is useful as a computational amplifier in making a differential to single-end conversion or in rejecting a common mode signal. Figure 4. shown the differential amplifier using CBM6001 family.

Figure 4. Differential Amplifier

$$V_{OUT} = \left(\frac{R_1 + R_2}{R_3 + R_4}\right) \frac{R_4}{R_1} V_{IN} - \frac{R2}{R1} V_{IP} + \left(\frac{R_1 + R_2}{R_3 + R_4}\right) \frac{R_3}{R_1} V_{REF}$$

If the resistor ratios are equal (i.e. $R_1=R_3$ and $R_2=R_4$), then

$$V_{OUT} = \frac{R_2}{R_1} (V_{IP} - V_{IN}) + V_{REF}$$

Low Pass Active Filter

The low pass active filter is shown in Figure 5. The DC gain is defined by $-R_2/R_1$. The filter has a -20dB/decade roll-off after its corner frequency $f_C=1/(2\pi R_3C_1)$.

Figure 5. Low Pass Active Filter

Instrumentation Amplifier

The triple CBM6001 family can be used to build a three-op-amp instrumentation amplifier as shown in Figure 6. The amplifier in Figure 6 is a high input impedance differential amplifier with gain of R_2/R_1 . The two differential voltage followers assure the high input impedance of the amplifier.
