FEATURES and FUNCTIONAL DIAGRAM

- Micro-power Omnipolar-Switch Hall Sensor
- Multiple Sensitivity Options (BOP / BRP):
$\pm 33 / \pm 23$ Gauss;
- Push-pull output ability
- Chopper stabilized design provides:
- Superior temperature stability
- Minimal switch point drift
- Enhanced immunity to physical stress
- On board voltage regulator for 1.65 V to 5.5 V range
- Push-pull Output (1 mA current ability)
- Solid-state reliability
- Wide Operating temperature range: -40 to $150^{\circ} \mathrm{C}$
- Small package sizes TO-92S, SOT-23
- RoHS-compliant material meets directive 2011/65/EU

PACKAGE

TO-92S

SOT-23-3L

## APPLICATIONS

Open and Close Detect for Flip/Slide Cellular Phones; -Smart Cover or Dock Detect for Cellular Phones and Tablet PCs; -Cover or Display Switch in Portable PCs (eg: Ultrabook); Digital Still, Video Cameras and Handheld Gaming Consoles; Door, Lids and Tray Position Switches; Level, Proximity and Position Switches; Contact-Less Switches in Home Appliances and Industrial Applications.

## DESCRIPTION

The CH912/CH912L is a high-sensitivity extremely temperature-stable micro-power Omnipolar Hall effect switch IC with internal pull up and pull down capability. Designed for portable and battery powered consumer equipment such as cellular phones and portable PCs to office equipment, home appliances and industrial applications, the average supply current is only $1.62 \mu \mathrm{~A}$ at $3,3 \mathrm{~V}$ for CH 912 and 0.92 uA at 3.3 V for CH912L. To support potable equipment, the CH912/CH912L can operate over the supply range of 1.65 V to 5.5 V and uses a hibernating clocking system to minimize the power consumption.

The device includes a clocking system, a Hall-voltage generator, a small-signal amplifier, a chopper stabilization, two Schmitt trigger, and an output driver controller.

The output is activated with either a north or south pole of sufficient magnetic field strength. When the magnetic flux density (B) perpendicular to the package is larger than operate point (Bop), the output will be turned on (pulled low) and held until $B$ is lower than release point (Brp).

Two package styles provide a magnetically optimized package for most applications, SOT-23 and TO92S. Each package type is lead (Pb) free (suffix, -T ), with a $100 \%$ matte-tin-plated leadframe.

2) MM (Machine Mode) according to AEC-Q100-003
3) CDM (charged device mode) according to AEC-Q100-011

## 5. Function Description

The CH912/CH912L exhibits Micro-power digital Omnipolar switching characteristics. Therefore, it requires only south poles or north poles to operate properly.
When the applied magnetic flux density exceeds the BOP threshold, the chip push-pull output goes low. The output stays low until the field decreases to less than BRP, and then the output goes to high.

A magnetic hysteresis BHYST keeps BOP and BRP separated by a minimal value. This hysteresis prevents output oscillation near the switching point.

Preliminary Datasheet 1.4
characteristics, the switch must be placed in a uniform magnetic field.

## 9. Application Information

### 9.1 Typical Application

It is recommended that an external capacitor $\mathrm{C}_{\mathbb{I N}}$ is connected to the supply. This can reduce the noise injected into the device. Normal 0.1 uF is suggested.

### 9.2 Device Output

If the device is powered on with a magnetic field strength between BRP and BOP, then the device output is indeterminate and can either be high or Low. If the field strength is greater than BOP, then the output is pulled low. If the field strength is less than BRP, then the output is pulled high.
