## General Description

The COS1415 and COS1416 are single channel power MOSFET drivers. Unique circuit design enables high speed operation capable of delivering peak currents of 1.5A into 1000pF capacitive loads. Improved speed and drive capability are enhanced by matched rise and fall delay times. These matched delays maintain the integrity of input-to-output pulse-widths to reduce timing errors and clock skew problems. Dynamic switching losses are minimized with non-overlapped drive techniques. These devices are highly latch-up resistant within their power and voltage ratings. They are not subject to damage when up to 5V of noise spiking (of either polarity) occurs on the ground pin.

## 1. Pin Configuration and Functions

### Pin Description

Pin No.		Pin Name	Description
COS1415/16	COS1415R/16R		
1	1	NC	No connection
2	5	VDD	Power Supply
3	3	IN	Control Input
4	2	GND	Ground
5	4	$\overline{\text{OUT}}$ /OUT	Output

### 1.1 Input (IN)

MOSFET driver input is a high-impedance, TTL/CMOS compatible input. The input also has 300 mV of hysteresis between the high and low thresholds that prevents output glitching even when the rise and fall time of the input signal is very slow.

### 1.2 Ground (GND)

Ground is the device return pin. The Ground pin(s) should have a low-impedance connection to the bias supply source return. High peak current flows out the Ground pin(s) when the capacitive load is being discharged.

### 1.3 Output (OUT)

MOSFET driver output is a low-impedance, CMOS push-pull style output. The pull-down and pull-up devices are of equal strength, making the rise and fall times equivalent.

### 1.4 Supply Input (V<sub>DD</sub>)

The VDD input is the bias supply for the MOSFET driver and is rated for 4.5V to 25V with respect to the Ground pin. The VDD input should be bypassed with local ceramic capacitors. The value of these capacitors should be chosen based on the capacitive load that is being driven. A value of 1.0  $\mu$ F is suggested.
