

PSoC[®] 4: PSoC 4000 Family Datasheet

Programmable System-on-Chip (PSoC®)

General Description

PSoC[®] 4 is a scalable and reconfigurable platform architecture for a family of programmable embedded system controllers with an ARM[®] Cortex[™]-M0 CPU. It combines programmable and reconfigurable analog and digital blocks with flexible automatic routing. The PSoC 4000 product family is the smallest member of the PSoC 4 platform architecture. It is a combination of a microcontroller with standard communication and timing peripherals, a capacitive touch-sensing system (CapSense) with best-in-class performance, and general-purpose analog. PSoC 4000 products will be fully upward compatible with members of the PSoC 4 platform for new applications and design needs.

Features

32-bit MCU Subsystem

- 16-MHz ARM Cortex-M0 CPU
- Up to 16 KB of flash with Read Accelerator
- Up to 2 KB of SRAM

Programmable Analog

- Two current DACs (IDACs) for general-purpose or capacitive sensing applications
- One low-power comparator with internal reference

Low Power 1.71-V to 5.5-V operation

■ Deep Sleep mode with wake-up on interrupt and I²C address detect

Capacitive Sensing

- Cypress CapSense Sigma-Delta (CSD) provides best-in-class signal-to-noise ratio (SNR) and water tolerance
- Cypress-supplied software component makes capacitive sensing design easy
- Automatic hardware tuning (SmartSense[™]) over a sensor range of 5 pF to 45 pF

Serial Communication

■ Multi-master I²C block with the ability to do address matching during Deep Sleep and generate a wake-up on match

Timing and Pulse-Width Modulation

- One 16-bit timer/counter/pulse-width modulator (TCPWM) block
- Center-aligned, Edge, and Pseudo-Random modes
- Comparator-based triggering of Kill signals for motor drive and other high-reliability digital logic applications

Up to 20 Programmable GPIO Pins

- 28-pin SSOP, 24-pin QFN, 16-pin SOIC, 16-pin QFN, 16 ball WLCSP, and 8-pin SOIC packages
- GPIO pins on Ports 0, 1, and 2 can be CapSense or have other functions
- Drive modes, strengths, and slew rates are programmable

PSoC Creator Design Environment

- Integrated Development Environment (IDE) provides schematic design entry and build (with analog and digital automatic routing)
- Applications Programming Interface (API) component for all fixed-function and programmable peripherals

Industry-Standard Tool Compatibility

 After schematic entry, development can be done with ARM-based industry-standard development tools

Cypress Semiconductor Corporation
Document Number: 001-89638 Rev. *I

More Information

Cypress provides a wealth of data at www.cypress.com to help you to select the right PSoC device for your design, and to help you to quickly and effectively integrate the device into your design. For a comprehensive list of resources, see the knowledge base article KBA86521, How to Design with PSoC 3, PSoC 4, and PSoC 5LP. Following is an abbreviated list for PSoC 4:

- Overview: PSoC Portfolio, PSoC Roadmap
- Product Selectors: PSoC 1, PSoC 3, PSoC 4, PSoC 5LP In addition, PSoC Creator includes a device selection tool.
- Application notes: Cypress offers a large number of PSoC application notes covering a broad range of topics, from basic to advanced level. Recommended application notes for getting started with PSoC 4 are:
 - □ AN79953: Getting Started With PSoC 4
 - □ AN88619: PSoC 4 Hardware Design Considerations
 - □ AN86439: Using PSoC 4 GPIO Pins
 - □ AN57821: Mixed Signal Circuit Board Layout
 - □ AN81623: Digital Design Best Practices

- □ AN73854: Introduction To Bootloaders
- □ AN89610: ARM Cortex Code Optimization
- Technical Reference Manual (TRM) is in two documents:
 - $\ensuremath{\square}$ Architecture TRM details each PSoC 4 functional block.
 - □ Registers TRM describes each of the PSoC 4 registers.
- Development Kits:
 - □ CY8CKIT-040, PSoC 4000 Pioneer Kit, is an easy-to-use and inexpensive development platform with debugging capability. This kit includes connectors for Arduino™ compatible shields and Digilent® Pmod™ daughter cards.
 - □ The MiniProg3 device provides an interface for flash programming and debug.

PSoC Creator

PSoC Creator is a free Windows-based Integrated Design Environment (IDE). It enables concurrent hardware and firmware design of PSoC 3, PSoC 4, and PSoC 5LP based systems. Create designs using classic, familiar schematic capture supported by over 100 pre-verified, production-ready PSoC Components; see the list of component datasheets. With PSoC Creator, you can:

- 1. Drag and drop component icons to build your hardware system design in the main design workspace
- Codesign your application firmware with the PSoC hardware, using the PSoC Creator IDE C compiler
- 3. Configure components using the configuration tools
- 4. Explore the library of 100+ components
- 5. Review component datasheets

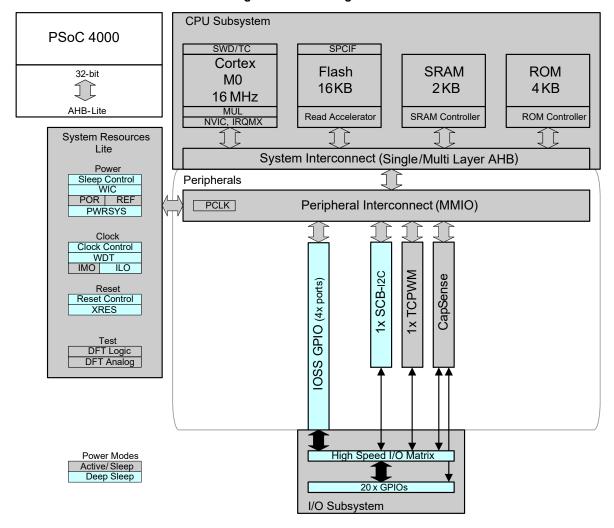

Figure 2. Block Diagram

PSoC 4000 devices include extensive support for programming, testing, debugging, and tracing both hardware and firmware.

The ARM Serial-Wire Debug (SWD) interface supports all programming and debug features of the device.

Complete debug-on-chip functionality enables full-device debugging in the final system using the standard production device. It does not require special interfaces, debugging pods, simulators, or emulators. Only the standard programming connections are required to fully support debug.

The PSoC Creator IDE provides fully integrated programming and debug support for the PSoC 4000 devices. The SWD interface is fully compatible with industry-standard third-party tools. The PSoC 4000 family provides a level of security not possible with multi-chip application solutions or with microcontrollers. It has the following advantages:

- Allows disabling of debug features
- Robust flash protection
- Allows customer-proprietary functionality to be implemented in on-chip programmable blocks

The debug circuits are enabled by default and can only be disabled in firmware. If they are not enabled, the only way to re-enable them is to erase the entire device, clear flash protection, and reprogram the device with new firmware that enables debugging.

Additionally, all device interfaces can be permanently disabled (device security) for applications concerned about phishing attacks due to a maliciously reprogrammed device or attempts to defeat security by starting and interrupting flash programming sequences. All programming, debug, and test interfaces are disabled when maximum device security is enabled. Therefore, PSoC 4000, with device security enabled, may not be returned for failure analysis. This is a trade-off the PSoC 4000 allows the customer to make.

Functional Definition

CPU and Memory Subsystem

CPU

The Cortex-M0 CPU in the PSoC 4000 is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. Most instructions are 16 bits in length and the CPU executes a subset of the Thumb-2 instruction set. This enables fully compatible, binary, upward migration of the code to higher performance processors, such as the Cortex-M3 and M4. It includes a nested vectored interrupt controller (NVIC) block with eight interrupt inputs and also includes a Wakeup Interrupt Controller (WIC). The WIC can wake the processor from the Deep Sleep mode, allowing power to be switched off to the main processor when the chip is in the Deep Sleep mode. The CPU subsystem also includes a 24-bit timer called SYSTICK, which can generate an interrupt.

The CPU also includes a debug interface, the serial wire debug (SWD) interface, which is a 2-wire form of JTAG. The debug configuration used for PSoC 4000 has four breakpoint (address) comparators and two watchpoint (data) comparators.

Flash

The PSoC 4000 device has a flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The low-power flash block is designed to deliver zero wait-state (WS) access time at 16 MHz.

SRAM

Two KB of SRAM are provided with zero wait-state access at 16 MHz.

SROM

A supervisory ROM that contains boot and configuration routines is provided.

System Resources

Power System

The power system is described in detail in the section on Power on page 12. It provides an assurance that voltage levels are as required for each respective mode and either delays mode entry (for example, on power-on reset (POR)) until voltage levels are as required for proper functionality, or generates resets (for example, on brown-out detection). The PSoC 4000 operates with a single external supply over the range of either 1.8 V ±5% (externally regulated) or 1.8 to 5.5 V (internally regulated) and has three different power modes, transitions between which are managed by the power system. The PSoC 4000 provides Active, Sleep, and Deep Sleep low-power modes.

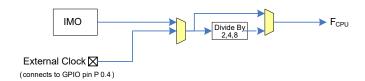

All subsystems are operational in Active mode. The CPU subsystem (CPU, flash, and SRAM) is clock-gated off in Sleep mode, while all peripherals and interrupts are active with instantaneous wake-up on a wake-up event. In Deep Sleep mode, the high-speed clock and associated circuitry is switched off; wake-up from this mode takes $35~\mu S$.

Clock System

The PSoC 4000 clock system is responsible for providing clocks to all subsystems that require clocks and for switching between different clock sources without glitching. In addition, the clock system ensures that there are no metastable conditions.

The clock system for the PSoC 4000 consists of the internal main oscillator (IMO) and the internal low-frequency oscillator (ILO) and provision for an external clock.

Figure 3. PSoC 4000 MCU Clocking Architecture

The F_{CPU} signal can be divided down to generate synchronous clocks for the analog and digital peripherals. There are four clock dividers for the PSoC 4000, each with 16-bit divide capability The 16-bit capability allows flexible generation of fine-grained frequency values and is fully supported in PSoC Creator.

IMO Clock Source

The IMO is the primary source of internal clocking in the PSoC 4000. It is trimmed during testing to achieve the specified accuracy. The IMO default frequency is 24 MHz and it can be adjusted from 24 to 48 MHz in steps of 4 MHz. The IMO tolerance with Cypress-provided calibration settings is $\pm 2\%$ (24 and 32 MHz).

ILO Clock Source

The ILO is a very low power, 40-kHz oscillator, which is primarily used to generate clocks for the watchdog timer (WDT) and peripheral operation in Deep Sleep mode. ILO-driven counters can be calibrated to the IMO to improve accuracy.

Watchdog Timer

A watchdog timer is implemented in the clock block running from the ILO; this allows watchdog operation during Deep Sleep and generates a watchdog reset if not serviced before the set timeout occurs. The watchdog reset is recorded in a Reset Cause register, which is firmware readable.

Reset

The PSoC 4000 can be reset from a variety of sources including a software reset. Reset events are asynchronous and guarantee reversion to a known state. The reset cause is recorded in a register, which is sticky through reset and allows software to determine the cause of the reset. An XRES pin is reserved for external reset on the 24-pin package. An internal POR is provided on the 16-pin and 8-pin packages. The XRES pin has an internal pull-up resistor that is always enabled. Reset is Active Low.

Voltage Reference

The PSoC 4000 reference system generates all internally required references. A 1.2-V voltage reference is provided for the comparator. The IDACs are based on a $\pm 5\%$ reference.

Analog Blocks

Low-power Comparators

The PSoC 4000 has a low-power comparator, which uses the built-in voltage reference. Any one of up to 16 pins can be used as a comparator input and the output of the comparator can be brought out to a pin. The selected comparator input is connected to the minus input of the comparator with the plus input always connected to the 1.2-V voltage reference. This comparator is also used for CapSense purposes and is not available during CapSense operation.

Current DACs

The PSoC 4000 has two IDACs, which can drive any of up to 16 pins on the chip. These IDACs have programmable current ranges.

Analog Multiplexed Buses

The PSoC 4000 has two concentric independent buses that go around the periphery of the chip. These buses (called amux buses) are connected to firmware-programmable analog switches that allow the chip's internal resources (IDACs, comparator) to connect to any pin on Ports 0, 1, and 2.

Fixed Function Digital

Timer/Counter/PWM (TCPWM) Block

The TCPWM block consists of a 16-bit counter with user-programmable period length. There is a capture register to record the count value at the time of an event (which may be an I/O event), a period register that is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals that are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow use as dead-band programmable complementary PWM outputs. It also has a Kill input to force outputs to a predetermined state; for example, this is used in motor drive systems when an over-current state is indicated and the PWM driving the FETs needs to be shut off immediately with no time for software intervention.

Serial Communication Block (SCB)

The PSoC 4000 has a serial communication block, which implements a multi-master I²C interface.

I²C Mode: The hardware I²C block implements a full multi-master and slave interface (it is capable of multi-master arbitration). This block is capable of operating at speeds of up to 400 kbps (Fast Mode) and has flexible buffering options to reduce interrupt overhead and latency for the CPU. It also supports EZI2C that creates a mailbox address range in the memory of the PSoC 4000 and effectively reduces I²C communication to reading from and writing to an array in memory. In addition, the block supports an 8-deep FIFO for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduces the need for clock stretching caused by the CPU not having read data on time.

The I²C peripheral is compatible with the I²C Standard-mode and Fast-mode devices as defined in the NXP I²C-bus specification and user manual (UM10204). The I²C bus I/O is implemented with GPIO in open-drain modes.

The PSoC 4000 is not completely compliant with the I²C spec in the following respect:

- GPIO cells are not overvoltage tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I²C system.
- Fast-mode minimum fall time is not met in Fast Strong mode; Slow Strong mode can help meet this spec depending on the Bus Load.

GPIO

The PSoC 4000 has up to 20 GPIOs. The GPIO block implements the following:

- Eight drive modes:
 - ☐ Analog input mode (input and output buffers disabled)
 - □ Input only
 - □ Weak pull-up with strong pull-down
 - ☐ Strong pull-up with weak pull-down
 - □ Open drain with strong pull-down
 - □ Open drain with strong pull-up
 - □ Strong pull-up with strong pull-down
 - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTL).
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes
- Selectable slew rates for dV/dt related noise control to improve FMI

The pins are organized in logical entities called ports, which are 8-bit in width (less for Ports 2 and 3). During power-on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin.

Data output and pin state registers store, respectively, the values to be driven on the pins and the states of the pins themselves.

Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it (4 for PSoC 4000).

The 28-pin and 24-pin packages have 20 GPIOs. The 16-pin SOIC has 13 GPIOs. The 16-pin QFN and the 16-ball WLCSP have 12 GPIOs. The 8-pin SOIC has 5 GPIOs.

Special Function Peripherals

CapSense

CapSense is supported in the PSoC 4000 through a CSD block that can be connected to up to 16 pins through an analog mux bus via an analog switch (pins on Port 3 are not available for CapSense purposes). CapSense function can thus be provided on any available pin or group of pins in a system under software control. A PSoC Creator component is provided for the CapSense block to make it easy for the user.

Shield voltage can be driven on another mux bus to provide water-tolerance capability. Water tolerance is provided by driving the shield electrode in phase with the sense electrode to keep the shield capacitance from attenuating the sensed input. Proximity sensing can also be implemented.

The CapSense block has two IDACs, which can be used for general purposes if CapSense is not being used (both IDACs are available in that case) or if CapSense is used without water tolerance (one IDAC is available).

Pinouts

All port pins support GPIO. Ports 0, 1, and 2 support CSD CapSense and analog multiplexed bus connections. TCPWM functions and Altewith port pins as follows for the five PSoC 4000 packages.

Table 1. Pin Descriptions

Descriptions of the Pin functions are as follows:

VDD: Power supply for both analog and digital sections.

VDDIO: Where available, this pin provides a separate voltage domain (see the Power section for details).

VSS: Ground pin.

VCCD: Regulated digital supply (1.8 V ±5%).

Pins belonging to Ports 0, 1, and 2 can all be used as CSD sense or shield pins connected to AMUXBUS A or B. They can also be used as the firmware, in addition to their alternate functions listed in the Table 1.

Pins on Port 3 can be used as GPIO, in addition to their alternate functions listed above.

The following packages are provided: 28-pin SSOP, 24-pin QFN, 16-pin QFN, 16-pin SOIC, and 8-pin SOIC.

Note

2. This pin is not to be used; it must be left floating.

Power

The following power system diagrams (Figure 9 and Figure 10) show the set of power supply pins as implemented for the PSoC 4000. The system has one regulator in Active mode for the digital circuitry. There is no analog regulator; the analog circuits run directly from the V_{DD} input. There is a separate regulator for the Deep Sleep mode. The supply voltage range is either 1.8 V $\pm 5\%$ (externally regulated) or 1.8 V to 5.5 V (unregulated externally; regulated internally) with all functions and circuits operating over that range.

The V_{DDIO} pin, available in the 16-pin QFN package, provides a separate voltage domain for the following pins: P3.0, P3.1, and P3.2. P3.0 and P3.1 can be I^2C pins and the chip can thus communicate with an I^2C system, running at a different voltage (where $V_{DDIO} \leq V_{DD}$). For example, V_{DD} can be 3.3 V and V_{DDIO} can be 1.8 V.

The PSoC 4000 family allows two distinct modes of power supply operation: Unregulated External Supply and Regulated External Supply.

Unregulated External Supply

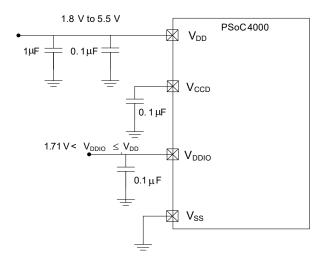

In this mode, the PSoC 4000 is powered by an external power supply that can be anywhere in the range of 1.8 to 5.5 V. This range is also designed for battery-powered operation. For example, the chip can be powered from a battery system that starts at 3.5 V and works down to 1.8 V. In this mode, the internal regulator of the PSoC 4000 supplies the internal logic and the V_{CCD} output of the PSoC 4000 must be bypassed to ground via an external capacitor (0.1 $\mu F;\, X5R$ ceramic or better).

Bypass capacitors must be used from V_{DD} to ground. The typical practice for systems in this frequency range is to use a capacitor in the 1-µF range, in parallel with a smaller capacitor (0.1 µF, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

An example of a bypass scheme follows ($V_{\mbox{\scriptsize DDIO}}$ is available on the 16-QFN package).

Figure 9. 16-pin QFN Bypass Scheme Example - Unregulated External Supply

Power supply connections when $1.8 \le V_{DD} \le 5.5 \text{ V}$

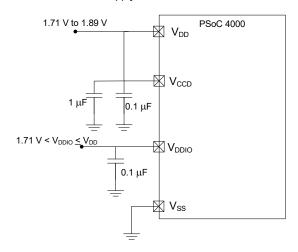

Regulated External Supply

In this mode, the PSoC 4000 is powered by an external power supply that must be within the range of 1.71 to 1.89 V; note that this range needs to include the power supply ripple too. In this mode, the V_{DD} and V_{CCD} pins are shorted together and bypassed. The internal regulator should be disabled in the firmware. Note that in this mode VDD (VCCD) should never exceed 1.89 in any condition, including flash programming.

An example of a bypass scheme follows (V_{DDIO} is available on the 16-QFN package).

Figure 10. 16-pin QFN Bypass Scheme Example - Regulated External Supply

Power supply connections when $1.71 \le V_{DD} \le 1.89 \text{ V}$

Development Support

The PSoC 4000 family has a rich set of documentation, development tools, and online resources to assist you during your development process. Visit www.cypress.com/go/psoc4 to find out more.

Documentation

A suite of documentation supports the PSoC 4000 family to ensure that you can find answers to your questions quickly. This section contains a list of some of the key documents.

Software User Guide: A step-by-step guide for using PSoC Creator. The software user guide shows you how the PSoC Creator build process works in detail, how to use source control with PSoC Creator, and much more.

Component Datasheets: The flexibility of PSoC allows the creation of new peripherals (components) long after the device has gone into production. Component data sheets provide all of the information needed to select and use a particular component, including a functional description, API documentation, example code, and AC/DC specifications.

Application Notes: PSoC application notes discuss a particular application of PSoC in depth; examples include brushless DC motor control and on-chip filtering. Application notes often include example projects in addition to the application note document.

Technical Reference Manual: The Technical Reference Manual (TRM) contains all the technical detail you need to use a PSoC device, including a complete description of all PSoC registers. The TRM is available in the Documentation section at www.cypress.com/psoc4.

Online

In addition to print documentation, the Cypress PSoC forums connect you with fellow PSoC users and experts in PSoC from around the world, 24 hours a day, 7 days a week.

Tools

With industry standard cores, programming, and debugging interfaces, the PSoC 4000 family is part of a development tool ecosystem. Visit us at www.cypress.com/go/psoccreator for the latest information on the revolutionary, easy to use PSoC Creator IDE, supported third party compilers, programmers, debuggers, and development kits.

Note

Document Number: 001-89638 Rev. *I Page 14 of 35

^{4.} Usage above the absolute maximum conditions listed in Table 1 may cause permanent damage to the device. Exposure to Absolute Maximum conditions for extended periods of time may affect device reliability. The Maximum Storage Temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below Absolute Maximum conditions but above normal operating conditions, the device may not operate to specification.

Table 4. DC Specifications (continued)

Typical values measured at V_{DD} = 3.3 V and 25 °C.

Spec ID#	Parameter	Description	Min	Тур	Max	Units	Details/ Conditions			
Deep Sleep Mode, V _{DD} = 3.6 to 5.5 V (Regulator on)										
SID34	I _{DD29}	I ² C wakeup and WDT on	_	2.5	12	μA				
Deep Sleep Me	Deep Sleep Mode, V _{DD} = V _{CCD} = 1.71 to 1.89 V (Regulator bypassed)

Notes
11. It can take as much as 20 milliseconds to write to Flash. During this time the device should not be Reset, or Flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.

Part Numbering Conventions

PSoC 4 devices follow the part numbering convention described in the following table. All fields are single-character alphanumeric (0, 1, 2, ..., 9, A,B, ..., Z) unless stated otherwise.

The part numbers are of the form CY8C4ABCDEF-XYZ where the fields are defined as follows.

Document Number: 001-89638 Rev. *I Page 23 of 35

The Field Values are listed in the following table:

Field	Description	Values	Meaning
CY8C	Cypress prefix		
4	Architecture	4	PSoC 4
Α	Family	0	4000 Family
В	CPU speed	1	16 MHz
ь	GFO speed	4	48 MHz
		3	8 KB
		4	16 KB
С	Flash capacity	5	32 KB
		6	64 KB
		7	128 KB
		SX	SOIC
DE	Package code	LQ	QFN
DE	Fackage code	PV	SSOP
		FN	WLCSP
F	Temperature range	I	Industrial
XYZ	Attributes code	000-999	Code of feature set in specific family

Packaging

Table 27. Package List

Spec ID#	Package	Description
BID#47A	28-Pin SSOP	28-pin 5 × 10 × 1.65mm SSOP with 0.65-mm pitch
BID#26	24-Pin QFN	24-pin 4 × 4 × 0.6 mm QFN with 0.5-mm pitch
BID#33	16-Pin QFN	16-pin 3 × 3 × 0.6 mm QFN with 0.5-mm pitch
BID#40	16-Pin SOIC	16-pin (150 Mil) SOIC
BID#47	8-Pin SOIC	8-pin (150 Mil) SOIC
BID#147A	16-Ball WLCSP (1.47 × 1.58mm)	16-Ball 1.47 × 1.58 × 0.4 mm
DID#147Α	16-Ball WLCSP (1.45 × 1.56mm)	16-Ball 1.45 × 1.56 × 0.4 mm

Table 28. Package Characteristics

Parameter	Description	Conditions	Min	Тур	Max	Units
T _A	Operating ambient temperature		-40	25	85	°C
T _J	Operating junction temperature		-40	-	100	°C
T _{JA}	Package θ _{JA} (28-pin SSOP)		-	66.6	-	°C/Watt
T_{JC}	Package θ _{JC} (28-pin SSOP)		_	34	-	°C/Watt
T _{JA}	Package θ _{JA} (24-pin QFN)		_	38	_	°C/Watt
T _{JC}	Package θ _{JC} (24-pin QFN)		_	5.6	_	°C/Watt
T _{JA}	Package θ _{JA} (16-pin QFN)		-	49.6	-	°C/Watt
T _{JC}	Package θ _{JC} (16-pin QFN)		-	5.9	-	°C/Watt
T _{JA}	Package θ _{JA} (16-pin SOIC)		-	142	-	°C/Watt
T _{JC}	Package θ _{JC} (16-pin SOIC)		-	49.8	-	°C/Watt
T _{JA}	Package θ _{JA} (16-ball WLCSP)		-	90	-	°C/Watt
T _{JC}	Package θ _{JC} (16-ball WLCSP)		-	0.9	-	°C/Watt
T _{JA}	Package θ _{JA} (8-pin SOIC)		_	198	-	°C/Watt
T _{JC}	Package θ _{JC} (8-pin SOIC)		_	56.9	_	°C/Watt

Table 29. Solder Reflow Peak Temperature

Package	Maximum Peak Temperature	Maximum Time at Peak Temperature			
All	260 °C	30 seconds			

Table 30. Package Moisture Sensitivity Level (MSL), IPC/JEDEC J-STD-020

Package Outline Drawings

Figure 11. 28-Pin SSOP Package Outline

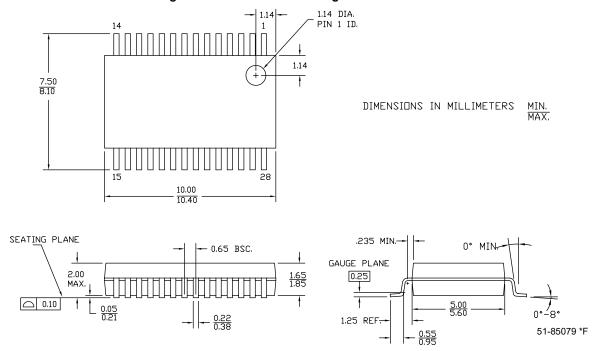

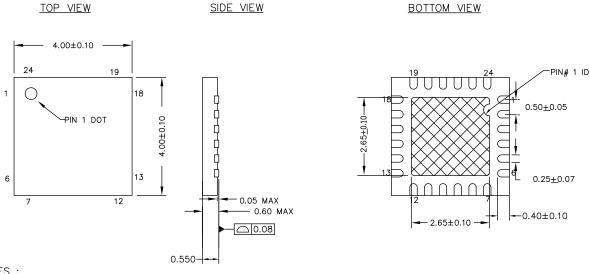

Figure 12. 24-pin QFN EPAD (Sawn) Package Outline

NOTES:

- 1. HATCH IS SOLDERABLE EXPOSED METAL.
- 2. REFERENCE JEDEC # MO-248
- 3. PACKAGE WEIGHT: $29 \pm 3 \text{ mg}$
- 4. ALL DIMENSIONS ARE IN MILLIMETERS

001-13937 *G

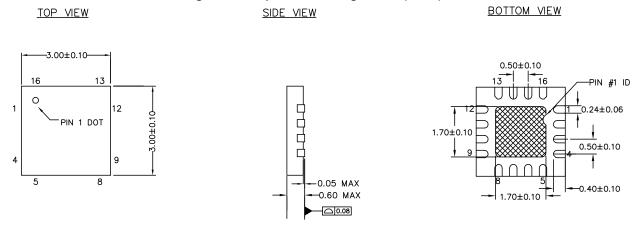

Note

15. Dimensions of the QFN package drawings are in millimeters.

The center pad on the QFN package should be connected to ground (VSS) for best mechanical, thermal, and electrical performance. If not connected to ground, it should be electrically floating and not connected to any other signal.

Figure 13. 16-pin QFN Package EPAD (Sawn)

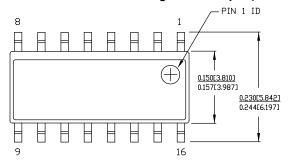

NOTES

- 1. HATCH AREA IS SOLDERABLE EXPOSED PAD
- 2. REFERENCE JEDEC # MO-248
- 3. ALL DIMENSIONS ARE IN MILLIMETERS

4. PACKAGE WEIGHT: See Cypress Package Material Declaration Datasheet (PMDD) posted on the Cypress web

001-87187 *A

Figure 14. 16-pin (150-mil) SOIC Package Outline

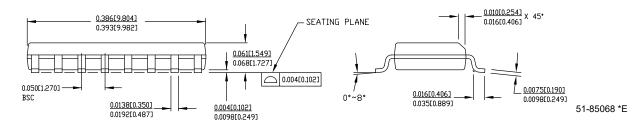

NOTE:

1. DIMENSIONS IN INCHESIMMI MANK.

- 2. REFERENCE JEDEC MS-012
- 3. PACKAGE WEIGHT : refer to PMDD spec. 001-04308

	PART #
\$16.15	STANDARD PKG.
SZ16.15	LEAD FREE PKG.

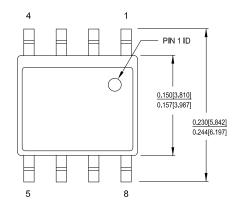

Note

16. Dimensions of the QFN package drawings are in inches [millimeters].

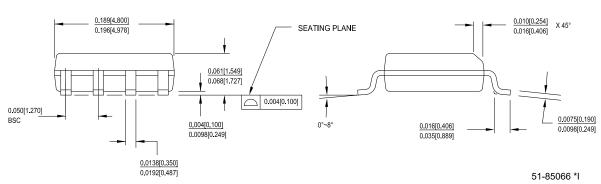

Figure 15. 8-pin (150-mil) SOIC Package Outline

8 Lead (150 Mil) SOIC - S08

- 1. DIMENSIONS IN INCHES[MM] $\frac{\text{MIN.}}{\text{MAX.}}$
- PIN 1 ID IS OPTIONAL,
 ROUND ON SINGLE LEADFRAME
 RECTANGULAR ON MATRIX LEADFRAME
- 3. REFERENCE JEDEC MS-012
- 4. PACKAGE WEIGHT 0.07gms

NOTES:

- 1. ALL DIMENSIONS ARE IN MILLIMETERS.
- 2. SOLDER BALL POSITION DESIGNATION PER JEP95, SECTION 3, SPP-020.

BOTTOM VIEW

- 3. "e" REPRESENTS THE SOLDER BALL GRID PITCH.
- 4. SYMBOL "MD" IS THE BALL MATRIX SIZE IN THE "D" DIRECTION.

 SYMBOL "ME" IS THE BALL MATRIX SIZE IN THE "E" DIRECTION.

 N IS THE NUMBER OF POPULATED SOLDER BALL POSITIONS FOR MATRIX SIZE MD X ME.
- ADMENSION "b" IS MEASURED AT THE MAXIMUM BALL DIAMETER IN A PLANE PARALLEL TO DATUM C.
- "SD" AND "SE" ARE MEASURED WITH RESPECT TO DATUMS A AND B AND DEFINE THE POSITION OF THE CENTER SOLDER BALL IN THE OUTER ROW.

 WHEN THERE IS AN ODD NUMBER OF SOLDER BALLS IN THE OUTER ROW,

 "SD" OR "SE" = 0.

 WHEN THERE IS AN EVEN NUMBER OF SOLDER BALLS IN THE OUTER ROW,
 - WHEN THERE IS AN EVEN NUMBER OF SOLDER BALLS IN THE OUTER ROW "SD" = eD/2 AND "SE" = eE/2.
- A1 CORNER TO BE IDENTIFIED BY CHAMFER, LASER OR INK MARK METALIZED MARK, INDENTATION OR OTHER MEANS.
- 8. "+" INDICATES THE THEORETICAL CENTER OF DEPOPULATED SOLDER BALLS.
- 9. JEDEC SPECIFICATION NO. REF.: N/A.

Acronyms

Table 31. Acronyms Used in this Document

Acronym	m Description	
abus	analog local bus	
ADC	analog-to-digital converter	
AG	analog global	
AHB	AMBA (advanced microcontroller bus architecture) high-performance bus, an ARM data transfer bus	
ALU	arithmetic logic unit	
AMUXBUS	analog multiplexer bus	
API	application programming interface	
APSR	application program status register	
ARM [®]	advanced RISC machine, a CPU architecture	
ATM	automatic thump mode	
BW	bandwidth	
CAN	Controller Area Network, a communications protocol	
CMRR	common-mode rejection ratio	
CPU	central processing unit	
CRC	cyclic redundancy check, an error-checking protocol	
DAC	digital-to-analog converter, see also IDAC, VDAC	
DFB	digital filter block	
DIO	digital input/output, GPIO with only digital capabilities, no analog. See GPIO.	
DMIPS	Dhrystone million instructions per second	
DMA	direct memory access, see also TD	
DNL	differential nonlinearity, see also INL	
DNU	do not use	
DR	port write data registers	
DSI	digital system interconnect	
DWT	data watchpoint and trace	
ECC	error correcting code	
ECO	external crystal oscillator	
EEPROM	electrically erasable programmable read-only memory	
EMI	electromagnetic interference	
EMIF	external memory interface	
EOC	end of conversion	
EOF	end of frame	
EPSR	execution program status register	
ESD	electrostatic discharge	
ETM embedded trace macrocell

Table 31. Acronyms Used in this Document (continued)

Acronym Description			
PGA	programmable gain amplifier		
PHUB	peripheral hub		
PHY	physical layer		
PICU	port interrupt control unit		
PLA	programmable logic array		
PLD	programmable logic device, see also PAL		
PLL	phase-locked loop		
PMDD	package material declaration data sheet		
POR	power-on reset		
PRES	precise power-on reset		
PRS	pseudo random sequence		
PS	port read data register		
PSoC [®]	Programmable System-on-Chip™		
PSRR	power supply rejection ratio		
PWM	pulse-width modulator		
RAM	random-access memory		
RISC	reduced-instruction-set computing		
RMS	root-mean-square		
RTC	real-time clock		
RTL	register transfer language		
RTR	remote transmission request		
RX	receive		
SAR	successive approximation register		
SC/CT	switched capacitor/continuous time		
SCL	I ² C serial clock		
SDA	I ² C serial data		
S/H	sample and hold		
SINAD	signal to noise and distortion ratio		
SIO	special input/output, GPIO with advanced features. See GPIO.		
SOC	start of conversion		
SOF	start of frame		
SPI	Serial Peripheral Interface, a communications protocol		
SR	slew rate		
SRAM	static random access memory		
SRES	software reset		
SWD	serial wire debug, a test protocol		
SWV	single-wire viewer		
TD	transaction descriptor, see also DMA		

Table 31. Acronyms Used in this Document (continued)

Acronym	Description	
THD	total harmonic distortion	
TIA	transimpedance amplifier	
TRM	technical reference manual	
TTL	transistor-transistor logic	
TX	transmit	
UART	Universal Asynchronous Transmitter Receiver, a communications protocol	
UDB	universal digital block	
USB	Universal Serial Bus	
USBIO	USB input/output, PSoC pins used to connect to a USB port	
VDAC	voltage DAC, see also DAC, IDAC	
WDT	watchdog timer	
WOL	write once latch, see also NVL	
WRES	watchdog timer reset	
XRES	external reset I/O pin	
XTAL	crystal

Units of Measure

Table 32. Units of Measure

Symbol	Unit of Measure	
°C	degrees Celsius	
dB	decibel	
fF	femto farad	
Hz	hertz	
KB	1024 bytes	
kbps	kilobits per second	
Khr	kilohour	
kHz	kilohertz	
kΩ	kilo ohm	
ksps	kilosamples per second	
LSB	least significant bit	
Mbps	megabits per second	
MHz	megahertz	
ΜΩ	mega-ohm	
Msps	megasamples per second	
μΑ	microampere	
μF	microfarad	

Table 32. Units of Measure (continued)

Symbol	Unit of Measure	
μH	microhenry	
μs	microsecond	
μV	microvolt	
μW	microwatt	
mA	milliampere	
ms	millisecond	
mV	millivolt	
nA	nanoampere	
ns	nanosecond	
nV	nanovolt	
Ω	ohm	
pF	picofarad	
ppm	parts per million	
ps	picosecond	
s	second	
sps	samples per second	
sqrtHz	square root of hertz	
V	volt	

Revision History

Description Title: PSoC [®] 4: PSoC 4000 Family Datasheet Programmable System-on-Chip (PSoC [®]) Document Number: 001-89638				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
*B	4348760	WKA	05/16/2014	New PSoC 4000 datasheet.
*C	4514139	WKA	10/27/2014	Added 28-pin SSOP pin and package details. Updated V _{REF} spec values. Updated conditions for SID174. Updated SID.CSD#15 values and description. Added spec SID339.
*D	4617283	WKA	01/09/2015	Corrected Development Kits information and PSoC Creator Example Project figure. Corrected typo in the ordering information table. Updated 28-pin SSOP package diagram.
*E	4735762	WKA	05/26/2015	Added 16-ball WLCSP pin and package details.
*F	5466193	WKA	10/07/2016	Updated Table 30. Updated 8-pin SOIC package diagram. Updated the template.
*G	5685079	TSEN	04/05/2017	Updated 16-ball WLCSP package details.
*H	5807014	JIAO	07/24/2017	Added Figure 17 (spec 001-95966 *C) in Packaging. Updated Table 27. Updated Ordering Information.
*	6189153	WKA	05/29/2018	Updated 8-pin SOIC and 24-pin QFN package drawings.
