

The following document contains information on Cypress products. The document has the series name, product name, and ordering part numbering with the prefix “MB”. However, Cypress will offer these products to new and existing customers with the series name, product name, and ordering part number with the prefix “CY”.

#### **How to Check the Ordering Part Number**

1. Go to [www.cypress.com/pcn](http://www.cypress.com/pcn).
2. Enter the keyword (for example, ordering part number) in the **SEARCH PCNS** field and click **Apply**.
3. Click the corresponding title from the search results.
4. Download the Affected Parts List file, which has details of all changes

#### **For More Information**

Please contact your local sales office for additional information about Cypress products and solutions.

#### **About Cypress**

Cypress is the leader in advanced embedded system solutions for the world's most innovative automotive, industrial, smart home appliances, consumer electronics and medical products. Cypress' microcontrollers, analog ICs, wireless and USB-based connectivity solutions and reliable, high-performance memories help engineers design differentiated products and get them to market first. Cypress is committed to providing customers with the best support and development resources on the planet enabling them to disrupt markets by creating new product categories in record time. To learn more, go to [www.cypress.com](http://www.cypress.com).

## **CMOS F<sup>2</sup>MC-8FX MB95390H Series 8-bit Microcontrollers**

MB95390H is a series of general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers of this series contain a variety of peripheral resources.

### **Features**

#### **F<sup>2</sup>MC-8FX CPU core**

Instruction set optimized for controllers

- Multiplication and division instructions
- 16-bit arithmetic operations
- Bit test branch instructions
- Bit manipulation instructions, etc.

#### **Clock**

- Selectable main clock source

Main OSC clock (up to 16.25 MHz, maximum machine clock frequency: 8.125 MHz)

External clock (up to 32.5 MHz, maximum machine clock frequency: 16.25 MHz)

Main CR clock (1/8/10/12.5 MHz  $\pm 2\%$  or  $\pm 2.5\%^*$ , maximum machine clock frequency: 12.5 MHz)

\*The main CR clock oscillation accuracy of a product in LQFP package (FPT-48P-M49 or FPT-52P-M02) is  $\pm 2\%$  and that of a product in QFN package (LCC-48P-M11) is  $\pm 2.5\%$ .

- Selectable subclock source

Sub-OSC clock (32.768 kHz)

External clock (32.768 kHz)

Sub-CR clock (Typ: 100 kHz, Min: 50 kHz, Max: 200 kHz)

#### **Timer**

- 8/16-bit composite timer  $\times 2$  channels
- 8/16-bit PPG  $\times 3$  channels
- 16-bit PPG  $\times 1$  channel (can work independently or together with the multi-pulse generator)
- 16-bit reload timer  $\times 1$  channel (can work independently or together with the multi-pulse generator)
- Time-base timer  $\times 1$  channel
- Watch prescaler  $\times 1$  channel

#### **UART/SIO $\times 1$ channel**

- Full duplex double buffer
- Capable of clock-asynchronous (UART) serial data transfer and clock-synchronous (SIO) serial data transfer

#### **I<sup>2</sup>C $\times 1$ channel**

- Built-in wake-up function

#### **Multi-pulse generator (MPG) (for DC motor control) $\times 1$ channel**

- 16-bit reload timer  $\times 1$  channel
- 16-bit PPG timer  $\times 1$  channel
- Waveform sequencer (including a 16-bit timer equipped with a buffer and a compare clear function)

#### **LIN-UART**

- Full duplex double buffer
- Capable of clock-synchronous serial data transfer and clock-asynchronous serial data transfer

#### **External interrupt $\times 8$ channels**

- Interrupt by edge detection (rising edge, falling edge, and both edges can be selected)
- Can be used to wake up the device from different low power consumption (standby) modes

#### **8/10-bit A/D converter $\times 12$ channels**

- 8-bit and 10-bit resolution can be chosen.

#### **Low power consumption (standby) modes**

- Stop mode
- Sleep mode
- Watch mode
- Time-base timer mode

#### **I/O port**

- MB95F394H/F396H/F398H (maximum no. of I/O ports: 44)  
General-purpose I/O ports (N-ch open drain)..... : 3  
General-purpose I/O ports (CMOS I/O)..... : 41
- MB95F394K/F396K/F398K (maximum no. of I/O ports: 45)  
General-purpose I/O ports (N-ch open drain)..... : 4  
General-purpose I/O ports (CMOS I/O)..... : 41

**On-chip debug**

- 1-wire serial control
- Serial writing supported (asynchronous mode)

**Hardware/software watchdog timer**

- Built-in hardware watchdog timer
- Built-in software watchdog timer

**Low-voltage detection reset circuit**

- Built-in low-voltage detector

**Clock supervisor counter**

- Built-in clock supervisor counter function

**Programmable port input voltage level**

- CMOS input level / hysteresis input level

**Dual operation Flash memory**

- The erase/write operation and the read operation can be executed in different banks (upper bank/lower bank) simultaneously.

**Flash memory security function**

- Protects the content of the Flash memory

**1. Product Line-up**

Part number	MB95F394H	MB95F396H	MB95F398H	MB95F394K	MB95F396K	MB95F398K
<b>Parameter</b>						
Type	Flash memory product					
Clock supervisor counter	It supervises the main clock oscillation.					
Program ROM capacity	20 Kbyte	36 Kbyte	60 Kbyte	20 Kbyte	36 Kbyte	60 Kbyte
RAM capacity	496 bytes	1008 bytes	2032 bytes	496 bytes	1008 bytes	2032 bytes
Low-voltage detection reset	No			Yes		
Reset input	Dedicated			Selected through software		
CPU functions	<ul style="list-style-type: none"> <li>• Number of basic instructions : 136</li> <li>• Instruction bit length : 8 bits</li> <li>• Instruction length : 1 to 3 bytes</li> <li>• Data bit length : 1, 8 and 16 bits</li> <li>• Minimum instruction execution time : 61.5 ns (with machine clock frequency = 16.25 MHz)</li> <li>• Interrupt processing time : 0.6 μs (with machine clock frequency = 16.25 MHz)</li> </ul>					
General-purpose I/O	<ul style="list-style-type: none"> <li>• I/O ports (Max) : 44</li> <li>• CMOS I/O : 41</li> <li>• N-ch open drain : 3</li> </ul>			<ul style="list-style-type: none"> <li>• I/O ports (Max) : 45</li> <li>• CMOS I/O : 41</li> <li>• N-ch open drain : 4</li> </ul>		
Time-base timer	Interval time: 0.256 ms to 8.3 s (with external clock frequency = 4 MHz)					
Hardware/software watchdog timer	<ul style="list-style-type: none"> <li>• Reset generation cycle               <ul style="list-style-type: none"> <li>- Main oscillation clock at 10 MHz: 105 ms (Min)</li> </ul> </li> <li>• The sub-CR clock can be used as the source clock of the hardware watchdog timer.</li> </ul>					
Wild register	It can be used to replace three bytes of data.					
LIN-UART	<ul style="list-style-type: none"> <li>• A wide range of communication speeds can be selected by a dedicated reload timer.</li> <li>• Clock-synchronous serial data transfer and clock-asynchronous serial data transfer is enabled.</li> <li>• The LIN function can be used as a LIN master or a LIN slave.</li> </ul>					
8/10-bit A/D converter	12 channels					
	8-bit resolution and 10-bit resolution can be chosen.					
8/16-bit composite timer	2 channels					
	<ul style="list-style-type: none"> <li>• The timer can be configured as an "8-bit timer × 2 channels" or a "16-bit timer × 1 channel".</li> <li>• It has the following functions: timer function, PWC function, PWM function and input capture function.</li> <li>• Count clock: it can be selected from internal clocks (seven types) and external clocks.</li> <li>• It can output square wave.</li> </ul>					
External interrupt	8 channels					
	<ul style="list-style-type: none"> <li>• Interrupt by edge detection (The rising edge, falling edge, or both edges can be selected.)</li> <li>• It can be used to wake up the device from different standby modes.</li> </ul>					
On-chip debug	<ul style="list-style-type: none"> <li>• 1-wire serial control</li> <li>• It supports serial writing. (asynchronous mode)</li> </ul>

### 3. Differences Among Products and Notes on Product Selection

#### ■ Current consumption

When using the on-chip debug function, take account of the current consumption of flash erase/write.

For details of current consumption, see “Electrical Characteristics”.

#### ■ Package

For details of information on each package, see “Packages and Corresponding Products” and “Package Dimension”.

#### ■ Operating voltage

The operating voltage varies, depending on whether the on-chip debug function is used or not.

For details of the operating voltage, see “Electrical Characteristics”.

#### ■ On-chip debug function

The on-chip debug function requires that  $V_{CC}$ ,  $V_{SS}$  and one serial wire be connected to an evaluation tool. For details of the connection method, refer to “CHAPTER 29 EXAMPLE OF SERIAL PROGRAMMING CONNECTION” in the hardware manual of the MB95390H Series.

**5. Pin Functions**

Pin no.			Pin name	I/O circuit type*4	Function
LQFP48*1	QFN48*2	LQFP52*3			
1	1	1	PG2	C	General-purpose I/O port
			X1A		Subclock I/O oscillation pin
			SN12		Trigger input pin for the position detection function of the MPG waveform sequencer
2	2	2	PG1	C	General-purpose I/O port
			X0A		Subclock input oscillation pin
			SN11		Trigger input pin for the position detection function of the MPG waveform sequencer
3	3	3	V <sub>CC</sub>	—	Power supply pin
4	4	4	C	—	Capacitor connection pin
5	5	5	P40	K	General-purpose I/O port
			AN08		A/D converter analog input pin
6	6	6	P41	K	General-purpose I/O port
			AN09		A/D converter analog input pin
—	—	7	NC	—	It is an internally connected pin. Always leave it unconnected.
7	7	8	P42	K	General-purpose I/O port
			AN10		A/D converter analog input pin
8	8	9	P43	K	General-purpose I/O port
			AN11		A/D converter analog input pin
9	9	10	P44	G	General-purpose I/O port
			TO1		16-bit reload timer ch. 0 output pin
10	10	11	P45	G	General-purpose I/O port
			SCK		LIN-UART clock I/O pin
11	11	12	P46	G	General-purpose I/O port
			SOT		LIN-UART data output pin
12	12	13	P47	J	General-purpose I/O port
			SIN		LIN-UART data input pin
13	13	14	P10	G	General-purpose I/O port
			PPG10		8/16-bit PPG ch. 1 output pin
14	14	15	P11	G	General-purpose I/O port
			PPG11		8/16-bit PPG ch. 1 output pin
15	15	16	P12	H	General-purpose I/O port
			DBG		DBG input pin
16	16	17	P13	G	General-purpose I/O port
			PPG00		8/16-bit PPG ch. 0 output pin

## 7. Notes On Device Handling

### ■ Preventing latch-ups

When using the device, ensure that the voltage applied does not exceed the maximum voltage rating.

In a CMOS IC, if a voltage higher than  $V_{CC}$  or a voltage lower than  $V_{SS}$  is applied to an input/output pin that is neither a medium-withstand voltage pin nor a high-withstand voltage pin, or if a voltage out of the rating range of power supply voltage mentioned in "14.1 Absolute Maximum Ratings" of "Electrical Characteristics" is applied to the  $V_{CC}$  pin or the  $V_{SS}$  pin, a latch-up may occur.

When a latch-up occurs, power supply current increases significantly, which may cause a component to be thermally destroyed.

### ■ Stabilizing supply voltage

Supply voltage must be stabilized.

A malfunction may occur when power supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the  $V_{CC}$  power supply voltage.

As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in  $V_{CC}$  ripple (p-p value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard  $V_{CC}$  value, and the transient fluctuation rate does not exceed 0.1 V/ms at a momentary fluctuation such as switching the power supply.

### ■ Notes on using the external clock

When an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from subclock mode or stop mode.

## 8. Pin Connection

### ■ Treatment of unused pins

If an unused input pin is left unconnected, a component may be permanently damaged due to malfunctions or latch-ups. Always pull up or pull down an unused input pin through a resistor of at least 2 k $\Omega$ . Set an unused input/output pin to the output state and leave it unconnected, or set it to the input state and treat it the same as an unused input pin. If there is an unused output pin, leave it unconnected.

## 9. Power supply pins

To reduce unnecessary electro-magnetic emission, prevent malfunctions of strobe signals due to an increase in the ground level, and conform to the total output current standard, always connect the  $V_{CC}$  pin and the  $V_{SS}$  pin to the power supply and ground outside the device. In addition, connect the current supply source to the  $V_{CC}$  pin and the  $V_{SS}$  pin with low impedance.

It is also advisable to connect a ceramic capacitor of approximately 0.1  $\mu$ F as a bypass capacitor between the  $V_{CC}$  pin and the  $V_{SS}$  pin at a location close to this device.

### ■ DBG pin

Connect the DBG pin directly to an external pull-up resistor.

To prevent the device from unintentionally entering the debug mode due to noise, minimize the distance between the DBG pin and the  $V_{CC}$  or  $V_{SS}$  pin when designing the layout of the printed circuit board.

The DBG pin should not stay at "L" level after power-on until the reset output is released.

### ■ $\overline{RST}$ pin

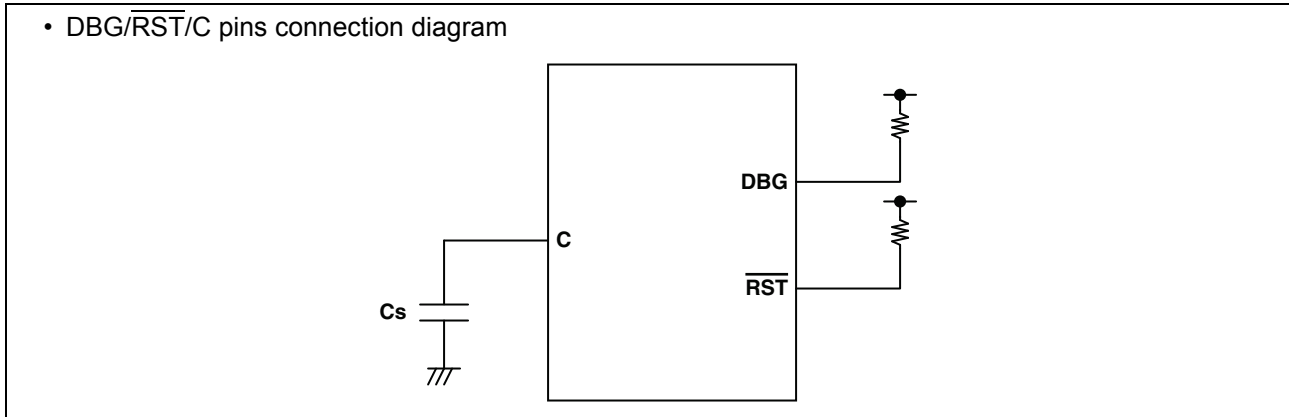

Connect the  $\overline{RST}$  pin directly to an external pull-up resistor.

To prevent the device from unintentionally entering the reset mode due to noise, minimize the distance between the  $\overline{RST}$  pin and the  $V_{CC}$  or  $V_{SS}$  pin when designing the layout of the printed circuit board.

The  $\overline{RST}$ /PF2 pin functions as the reset input/output pin after power-on. In addition, the reset output of the  $\overline{RST}$ /PF2 pin can be enabled by the RSTOE bit in the SYSC register, and the reset input function and the general purpose I/O function can be selected by the RSTEN bit in the SYSC register.

■ C pin

Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the  $V_{CC}$  pin must have a capacitance larger than  $C_S$ . For the connection to a smoothing capacitor  $C_S$ , see the diagram below. To prevent the device from unintentionally entering a mode to which the device is not set to transit due to noise, minimize the distance between the C pin and  $C_S$  and the distance between  $C_S$  and the  $V_{SS}$  pin when designing the layout of a printed circuit board.

## 11. CPU Core

### ■ Memory Space

The memory space of the MB95390H Series is 64 Kbyte in size, and consists of an I/O area, a data area, and a program area. The memory space includes areas intended for specific purposes such as general-purpose registers and a vector table. The memory maps of the MB95390H Series are shown below.

### ■ Memory Maps

**12. I/O Map**

Address	Register abbreviation	Register name	R/W	Initial value

■ R/W access symbols

R/W : Readable / Writable

R : Read only

W : Write only

■ Initial value symbols

0 : The initial value of this bit is “0”.

1 : The initial value of this bit is “1”.

X : The initial value of this bit is indeterminate.

**Note:** Do not write to an address that is “(Disabled)”. If a “(Disabled)” address is read, an indeterminate value is returned.

**13. Interrupt Source Table**

Interrupt source	Interrupt request number	Vector table address		Bit name of interrupt level setting register	Priority order of interrupt sources of the same level (occurring simultaneously)

## 14. Electrical Characteristics

### 14.1 Absolute Maximum Ratings

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage*1	$V_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6$	V	
Input voltage*1	$V_I$	$V_{SS} - 0.3$	$V_{SS} + 6$	V	*2
Output voltage*1	$V_O$	$V_{SS} - 0.3$	$V_{SS} + 6$	V	*2
Maximum clamp current	$I_{CLAMP}$	-2	+2	mA	Applicable to specific pins*3
Total maximum clamp current	$\sum  I_{CLAMP} $	—	20	mA	Applicable to specific pins*3
"L" level maximum output current	$I_{OL1}$	—	15	mA	Other than P62 to P67
	$I_{OL2}$	—	15		P62 to P67
"L" level average current	$I_{OLAV1}$	—	4	mA	Other than P62 to P67 Average output current = operating current × operating ratio (1 pin)
	$I_{OLAV2}$	—	12		P62 to P67 Average output current = operating current × operating ratio (1 pin)
"L" level total maximum output current	$\sum I_{OL}$	—	100	mA	
"L" level total average output current	$\sum I_{OLAV}$	—	50	mA	Total average output current = operating current × operating ratio (Total number of pins)
"H" level maximum output current	$I_{OH1}$	—	-15	mA	Other than P12, P62 to P67, P72, P73 and PF2
	$I_{OH2}$	—	-15		P12, P62 to P67, P72, P73 and PF2
"H" level average current	$I_{OHAV1}$	—	-4	mA	Other than P12, P62 to P67, P72, P73 and PF2 Average output current = operating current × operating ratio (1 pin)
	$I_{OHAV2}$	—	-8		P12, P62 to P67, P72, P73 and PF2 Average output current = operating current × operating ratio (1 pin)
"H" level total maximum output current	$\sum I_{OH}$	—	-100	mA	
"H" level total average output current	$\sum I_{OHAV}$	—	-50	mA	Total average output current = operating current × operating ratio (Total number of pins)
Power consumption	$P_d$	—	320	mW	
Operating temperature	$T_A$	-40	+85	°C	
Storage temperature	$T_{stg}$	-55	+150	°C	

(Continued)

(Continued)

\*1: The parameter is based on  $V_{SS} = 0.0\text{ V}$ .

\*2:  $V_I$  and  $V_O$  must not exceed  $V_{CC} + 0.3\text{ V}$ .  $V_I$  must not exceed the rated voltage. However, if the maximum current to/from an input is limited by means of an external component, the  $I_{CLAMP}$  rating is used instead of the  $V_I$  rating.

\*3: Applicable to the following pins: P00 to P07, P10, P11, P13 to P17, P40 to P47, P60 to P67, P70, P71, P74 to P77, PF0, PF1, PG1 and PG2

- Use under recommended operating conditions.
- Use with DC voltage (current).
- The HV (High Voltage) signal is an input signal exceeding the  $V_{CC}$  voltage. Always connect a limiting resistor between the HV (High Voltage) signal and the microcontroller before applying the HV (High Voltage) signal.
- The value of the limiting resistor should be set to a value at which the current to be input to the microcontroller pin when the HV (High Voltage) signal is input is below the standard value, irrespective of whether the current is transient current or stationary current.
- When the microcontroller drive current is low, such as in low power consumption modes, the HV (High Voltage) input potential may pass through the protective diode to increase the potential of the  $V_{CC}$  pin, affecting other devices.
- If the HV (High Voltage) signal is input when the microcontroller power supply is off (not fixed at 0 V), since power is supplied from the pins, incomplete operations may be executed.
- If the HV (High Voltage) input is input after power-on, since power is supplied from the pins, the voltage of power supply may not be sufficient to enable a power-on reset.
- Do not leave the HV (High Voltage) input pin unconnected.
- Example of a recommended circuit

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

**14.2 Recommended Operating Conditions**

 (V<sub>SS</sub> = 0.0 V)

Parameter	Symbol	Value		Unit	Remarks	
		Min	Max			
Power supply voltage	V <sub>CC</sub>	2.4*1*2	5.5*1	V	In normal operation	Other than on-chip debug mode
		2.3	5.5		Hold condition in stop mode	
		2.9	5.5		In normal operation	On-chip debug mode
		2.3	5.5		Hold condition in stop mode	
Smoothing capacitor	C <sub>S</sub>	0.022	1	μF	*3	
Operating temperature	T <sub>A</sub>	-40	+85	°C	Other than on-chip debug mode	
		+5	+35		On-chip debug mode	

\*1: The value varies depending on the operating frequency, the machine clock and the analog guaranteed range.

\*2: This value becomes 2.88 V when the low-voltage detection reset is used.

\*3: Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The bypass capacitor for the V<sub>CC</sub> pin must have a capacitance larger than C<sub>S</sub>. For the connection to a smoothing capacitor C<sub>S</sub>, see the diagram below. To prevent the device from unintentionally entering an unknown mode due to noise, minimize the distance between the C pin and C<sub>S</sub> and the distance between C<sub>S</sub> and the V<sub>SS</sub> pin when designing the layout of a printed circuit board.

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges.

Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

**14.3 DC Characteristics**
 $(V_{CC} = 5.0 V \pm 10\%, V_{SS} = 0.0 V, T_A = -40^\circ C \text{ to } +85^\circ C)$ 

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ <sup>*3</sup>	Max		
"H" level input voltage	$V_{IHI}$	P47, P72, P73, P77	*1	$0.7 V_{CC}$	—	$V_{CC} + 0.3$	V	When CMOS input level (hysteresis input) is selected
	$V_{IHS}$	P00 to P07, P10 to P17, P40 to P47, P60 to P67, P70 to P77, PF0, PF1, PG1, PG2	*1	$0.8 V_{CC}$	—	$V_{CC} + 0.3$	V	Hysteresis input
	$V_{IHM}$	PF2	—	$0.7 V_{CC}$	—	$V_{CC} + 0.3$	V	Hysteresis input
"L" level input voltage	$V_{IL}$	P47, P72, P73, P77	*1	$V_{SS} - 0.3$	—	$0.3 V_{CC}$	V	When CMOS input level (hysteresis input) is selected
	$V_{ILS}$	P00 to P07, P10 to P17, P40 to P47, P60 to P67, P70 to P77, PF0, PF1, PG1, PG2	*1	$V_{SS} - 0.3$	—	$0.2 V_{CC}$	V	Hysteresis input

(Continued)

(Continued)

 ( $V_{CC} = 5.0\text{ V} \pm 10\%$ ,  $V_{SS} = 0.0\text{ V}$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ <sup>*3</sup>	Max		
Power supply current <sup>*2</sup>	$I_{CCTS}$	$V_{CC}$ (External clock operation)	$V_{CC} = 5.5\text{ V}$ $F_{CH} = 32\text{ MHz}$ Time-base timer mode $T_A = +25^\circ\text{C}$	—	0.9	3	mA	
	$I_{CCH}$		$V_{CC} = 5.5\text{ V}$ Substop mode $T_A = +25^\circ\text{C}$	—	3.4	22.5	$\mu\text{A}$	
	$I_{LVD}$	$V_{CC}$	Current consumption for low-voltage detection circuit only	—	31	54	$\mu\text{A}$	
	$I_{CRH}$		Current consumption for the main CR oscillator	—	0.5	0.6	mA	
	$I_{CRL}$		Current consumption for the sub-CR oscillator oscillating at 100 kHz	—	20	72	$\mu\text{A}$	

\*1: The input levels of P47, P72, P73 and P77 can be switched between “CMOS input level” and “hysteresis input level”. The input level selection register (ILSR) is used to switch between the two input levels.

\*2: • The power supply current is determined by the external clock. When the low-voltage detection option is selected, the power-supply current will be the sum of adding the current consumption of the low-voltage detection circuit ( $I_{LVD}$ ) to one of the value from  $I_{CC}$  to  $I_{CCH}$ . In addition, when both the low-voltage detection option and the CR oscillator are selected, the power supply current will be the sum of adding up the current consumption of the low-voltage detection circuit, the current consumption of the CR oscillators ( $I_{CRH}$ ,  $I_{CRL}$ ) and a specified value. In on-chip debug mode, the CR oscillator ( $I_{CRH}$ ) and the low-voltage detection circuit are always enabled, and current consumption therefore increases accordingly.

• See "AC Characteristics: Clock Timing" for  $F_{CH}$  and  $F_{CL}$ .

• See "AC Characteristics: Source Clock/Machine Clock" for  $F_{MP}$  and  $F_{MPL}$ .

\*1: This is the clock before it is divided according to the division ratio set by the machine clock divide ratio select bits (SYCC:DIV1, DIV0). This source clock is divided to become a machine clock according to the divide ratio set by the machine clock divide ratio select bits (SYCC:DIV1, DIV0). In addition, a source clock can be selected from the following.

- Main clock divided by 2
- Main CR clock
- Subclock divided by 2
- Sub-CR clock divided by 2

\*2: This is the operating clock of the microcontroller. A machine clock can be selected from the following.

- Source clock (no division)
- Source clock divided by 4
- Source clock divided by 8
- Source clock divided by 16

• Schematic diagram of the clock generation block

• Operating voltage - Operating frequency (When  $T_A = -40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ )  
MB95390H (without the on-chip debug function)

• Operating voltage - Operating frequency (When  $T_A = -40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ )  
MB95390H (with the on-chip debug function)

14.4.3 External Reset

( $V_{CC} = 5.0 V \pm 10\%$ ,  $V_{SS} = 0.0 V$ ,  $T_A = -40^\circ C$  to  $+85^\circ C$ )

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
$\overline{RST}$ "L" level pulse width	$t_{RSTL}$	$2 t_{MCLK}^{*1}$	—	ns	In normal operation
		Oscillation time of the oscillator <sup>*2</sup> + 100	—	$\mu s$	In stop mode, subclock mode, subsleep mode, watch mode, and power-on
		100	—	$\mu s$	In time-base timer mode

\*1: See "Source Clock/Machine Clock" for  $t_{MCLK}$ .

\*2: The oscillation time of an oscillator is the time for it to reach 90% of its amplitude. The crystal oscillator has an oscillation time of between several ms and tens of ms. The ceramic oscillator has an oscillation time of between hundreds of  $\mu s$  and several ms. The external clock has an oscillation time of 0 ms. The CR oscillator clock has an oscillation time of between several  $\mu s$  and several ms.

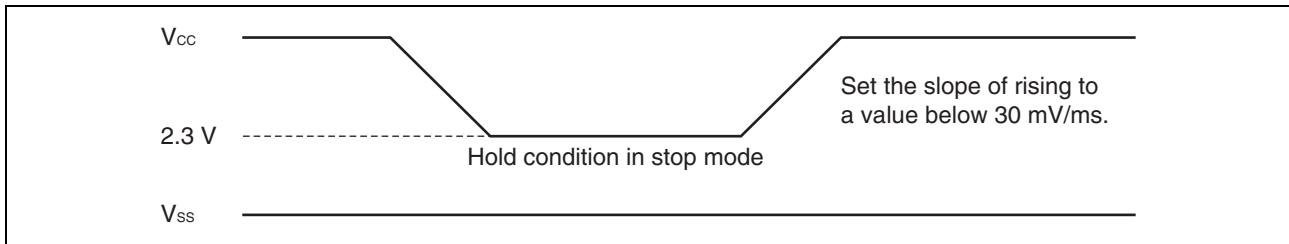

14.4.4 Power-on Reset

( $V_{SS} = 0.0\text{ V}$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )

Parameter	Symbol	Condition	Value		Unit	Remarks
			Min	Max		
Power supply rising time	$t_R$	—	—	50	ms	
Power supply cutoff time	$t_{OFF}$	—	1	—	ms	Wait time until power-on

**Note:** A sudden change of power supply voltage may activate the power-on reset function. When changing the power supply voltage during the operation, set the slope of rising to a value below within 30 mV/ms as shown below.

14.4.5 Peripheral Input Timing

( $V_{CC} = 5.0 V \pm 10\%$ ,  $V_{SS} = 0.0 V$ ,  $T_A = -40^\circ C$  to  $+85^\circ C$ )

Parameter	Symbol	Pin name	Value		Unit
			Min	Max	
Peripheral input "H" pulse width	$t_{ILIH}$	INT00 to INT07, EC0, EC1, TI1, TRG1	$2 t_{MCLK}^*$	—	ns
Peripheral input "L" pulse width	$t_{IHIL}$		$2 t_{MCLK}^*$	—	ns

\*: See "Source Clock/Machine Clock" for  $t_{MCLK}$ .

**14.4.6 LIN-UART Timing**

Sampling is executed at the rising edge of the sampling clock\*<sup>1</sup>, and serial clock delay is disabled\*<sup>2</sup>.  
 (ESCR register: SCES bit = 0, ECCR register: SCDE bit = 0)

( $V_{CC} = 5.0\text{ V} \pm 10\%$ ,  $AV_{SS} = V_{SS} = 0.0\text{ V}$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )

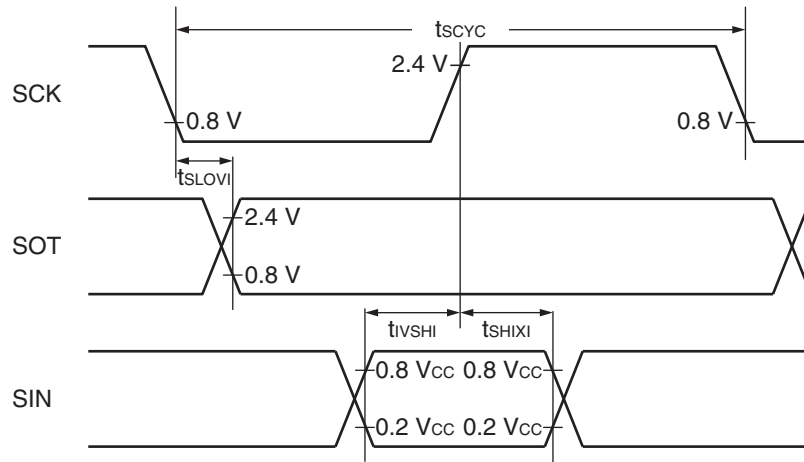

Parameter	Symbol	Pin name	Condition	Value		Unit
				Min	Max	
Serial clock cycle time	$t_{SCYC}$	SCK	Internal clock operation output pin: $C_L = 80\text{ pF} + 1\text{ TTL}$	$5 t_{MCLK}^{*3}$	—	ns
SCK ↓ → SOT delay time	$t_{SLOVI}$	SCK, SOT		-95	+95	ns
Valid SIN → SCK ↑	$t_{IVSHI}$	SCK, SIN		$t_{MCLK}^{*3} + 190$	—	ns
SCK ↑ → valid SIN hold time	$t_{SHIXI}$	SCK, SIN		0	—	ns
Serial clock "L" pulse width	$t_{SLSH}$	SCK	External clock operation output pin: $C_L = 80\text{ pF} + 1\text{ TTL}$	$3 t_{MCLK}^{*3} - t_R$	—	ns
Serial clock "H" pulse width	$t_{SHSL}$	SCK		$t_{MCLK}^{*3} + 95$	—	ns
SCK ↓ → SOT delay time	$t_{SLOVE}$	SCK, SOT		—	$2 t_{MCLK}^{*3} + 95$	ns
Valid SIN → SCK ↑	$t_{IVSHE}$	SCK, SIN		190	—	ns
SCK ↑ → valid SIN hold time	$t_{SHIXE}$	SCK, SIN		$t_{MCLK}^{*3} + 95$	—	ns
SCK fall time	$t_F$	SCK		—	10	ns
SCK rise time	$t_R$	SCK		—	10	ns

\*1: There is a function used to choose whether the sampling of reception data is performed at a rising edge or a falling edge of the serial clock.

\*2: The serial clock delay function is a function used to delay the output signal of the serial clock for half the clock.

\*3: See "Source Clock/Machine Clock" for  $t_{MCLK}$ .

• Internal shift clock mode

• External shift clock mode

Sampling is executed at the falling edge of the sampling clock\*<sup>1</sup>, and serial clock delay is disabled\*<sup>2</sup>.

14.5.2 Notes on Using the A/D Converter

External impedance of analog input and its sampling time

- The A/D converter has a sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the capacitor of the internal sample and hold circuit is insufficient, adversely affecting A/D conversion precision. Therefore, to satisfy the A/D conversion precision standard, considering the relationship between the external impedance and minimum sampling time, either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. In addition, if sufficient sampling time cannot be secured, connect a capacitor of about 0.1 μF to the analog input pin.

• Analog input equivalent circuit

V <sub>CC</sub>	R	C
4.5 V ≤ V <sub>CC</sub> ≤ 5.5 V	1.95 kΩ (Max)	17 pF (Max)
4.0 V ≤ V <sub>CC</sub> < 4.5 V	8.98 kΩ (Max)	17 pF (Max)

Note: The values are reference values.

• Relationship between external impedance and minimum sampling time

[External impedance = 0 kΩ to 100 kΩ]

[External impedance = 0 kΩ to 20 kΩ]

A/D conversion error

As |V<sub>CC</sub>-V<sub>SS</sub>| decreases, the A/D conversion error increases proportionately.

14.5.3 Definitions of A/D Converter Terms

- Resolution  
It indicates the level of analog variation that can be distinguished by the A/D converter. When the number of bits is 10, analog voltage can be divided into  $2^{10} = 1024$ .
- Linearity error (unit: LSB)  
It indicates how much an actual conversion value deviates from the straight line connecting the zero transition point (“00 0000 0000” ← → “00 0000 0001”) of a device to the full-scale transition point (“11 1111 1111” ← → “11 1111 1110”) of the same device.
- Differential linear error (unit: LSB)  
It indicates how much the input voltage required to change the output code by 1 LSB deviates from an ideal value.
- Total error (unit: LSB)  
It indicates the difference between an actual value and a theoretical value. The error can be caused by a zero transition error, a full-scale transition errors, a linearity error, a quantum error, or noise.

\*1: T<sub>A</sub> = +25°C, V<sub>CC</sub> = 5.0 V, 100000 cycles

\*2: T<sub>A</sub> = +85°C, V<sub>CC</sub> = 3.0 V, 100000 cycles

\*3: This value is converted from the result of a technology reliability assessment. (The value is converted from the result of a high temperature accelerated test using the Arrhenius equation with the average temperature being +85°C).

### 15. Sample Characteristics

■ Power supply current temperature characteristics

(Continued)

$I_{CCLS} - V_{CC}$   
 $T_A = +25^\circ\text{C}$ ,  $F_{MPL} = 16\text{ kHz}$  (divided by 2)  
 Subsleep mode with the external clock operating

$I_{CCLS} - T_A$   
 $V_{CC} = 5.5\text{ V}$ ,  $F_{MPL} = 16\text{ kHz}$  (divided by 2)  
 Subsleep mode with the external clock operating

$I_{CCT} - V_{CC}$   
 $T_A = +25^\circ\text{C}$ ,  $F_{MPL} = 16\text{ kHz}$  (divided by 2)  
 Watch mode with the external clock operating

$I_{CCT} - T_A$   
 $V_{CC} = 5.5\text{ V}$ ,  $F_{MPL} = 16\text{ kHz}$  (divided by 2)  
 Watch mode with the external clock operating

$I_{CTS} - V_{CC}$   
 $T_A = +25^\circ\text{C}$ ,  $F_{MP} = 2, 4, 8, 10, 16\text{ MHz}$  (divided by 2)  
 Time-base timer mode with the external clock operating

$I_{CTS} - T_A$   
 $V_{CC} = 5.5\text{ V}$ ,  $F_{MPL} = 10, 16\text{ kHz}$  (divided by 2)  
 Time-base timer mode with the external clock operating

$I_{CCH} - V_{CC}$   
 $T_A = +25^\circ\text{C}, F_{MPL} = (\text{stop})$   
 Substop mode with the external clock stopping

$I_{CCH} - T_A$   
 $V_{CC} = 5.5 \text{ V}, F_{MPL} = (\text{stop})$   
 Substop mode with the external clock stopping

$I_{CCMCR} - V_{CC}$   
 $T_A = +25^\circ\text{C}, F_{MP} = 1, 8, 10, 12.5 \text{ MHz (no division)}$   
 Main clock mode with the main CR clock operating

$I_{CCMCR} - T_A$   
 $V_{CC} = 5.5 \text{ V}, F_{MP} = 1, 8, 10, 12.5 \text{ MHz (no division)}$   
 Main clock mode with the main CR clock operating

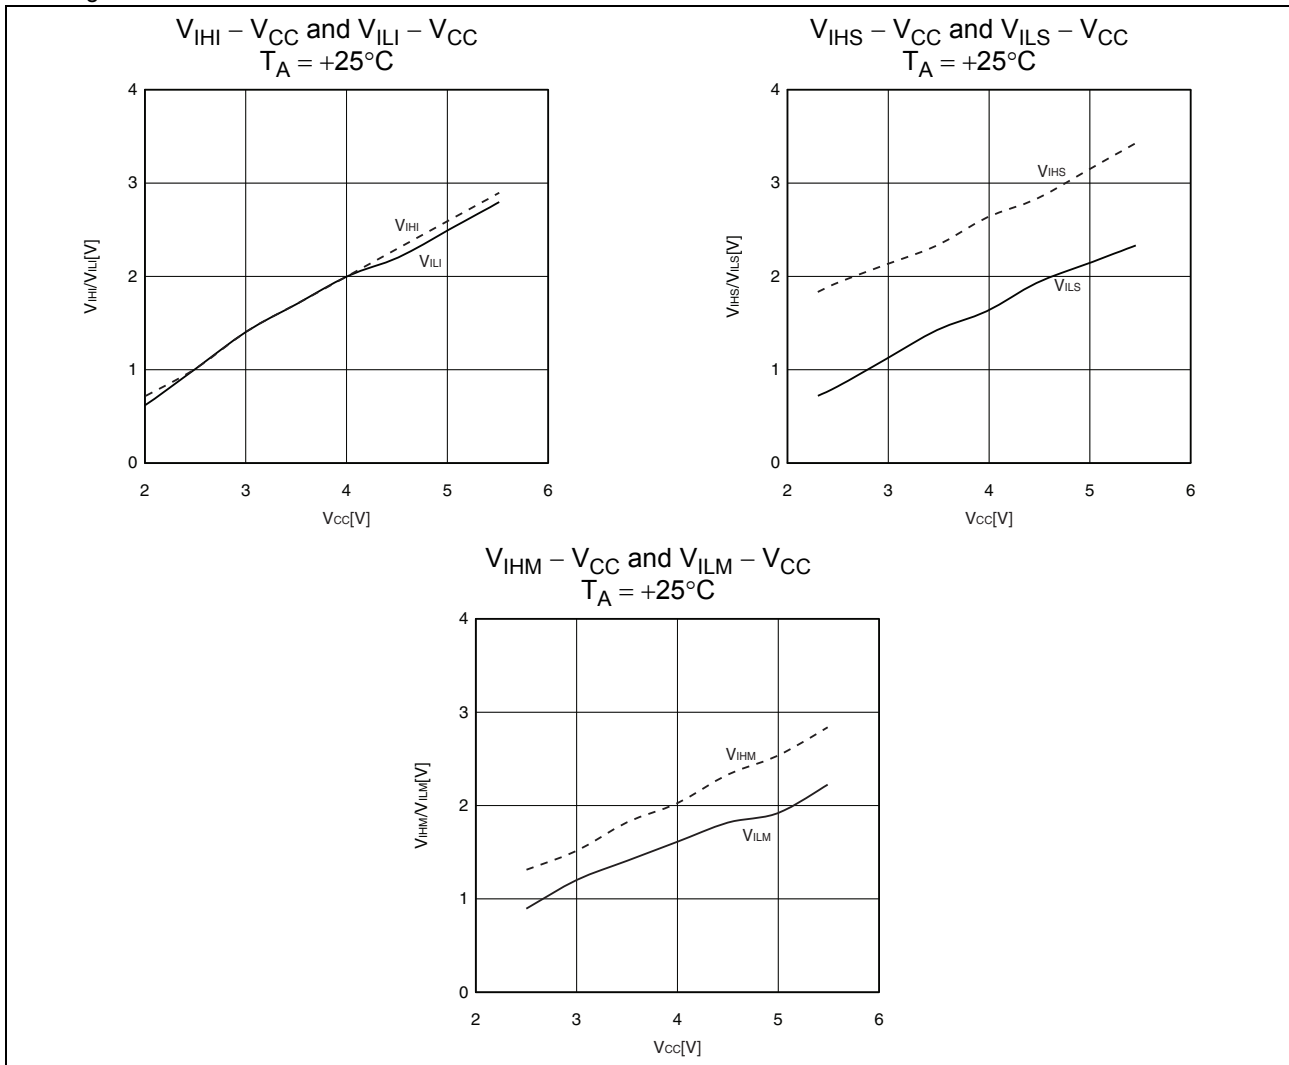

$I_{CCSCR} - V_{CC}$   
 $T_A = +25^\circ\text{C}, F_{MPL} = 50 \text{ kHz (divided by 2)}$   
 Subclock mode with the sub-CR clock operating

$I_{CCSCR} - T_A$   
 $V_{CC} = 5.5 \text{ V}, F_{MPL} = 50 \text{ kHz (divided by 2)}$   
 Subclock mode with the sub-CR clock operating

**18. Package Dimension**

<p style="text-align: center;">48-pin plastic LQFP</p> <p style="text-align: center;">(FPT-48P-M49)</p>	Lead pitch	0.50 mm
	Package width × package length	7.00 mm × 7.00 mm
	Lead shape	Gullwing
	Lead bend direction	Normal bend
	Sealing method	Plastic mold
	Mounting height	1.70 mm MAX
	Weight	0.17 g

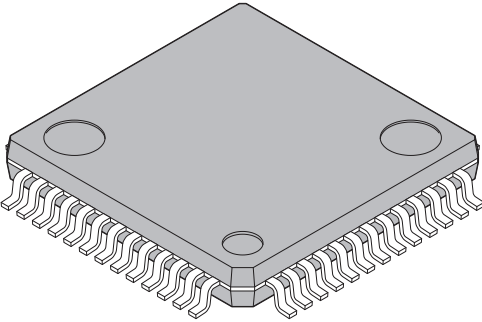

48-pin plastic LQFP (FPT-48P-M49)

Note 1) \* : These dimensions do not include resin protrusion.  
 Note 2) Pins width and pins thickness include plating thickness.  
 Note 3) Pins width do not include tie bar cutting remainder.

	Weight	0.12 g	

## 19. Major Changes

Page	Section	Details
1	Features	Changed the main CR clock oscillation accuracy. $\pm 2\% \rightarrow \pm 2\%$ or $\pm 2.5\%$  Added a remark about the main CR clock accuracy.
4	Product Line-up	Added FPT-52P-M02.
5	Packages And Corresponding Products	Added FPT-52P-M02.
6	Differences Among Products And Notes On Product Selection	Added a reference for the connection method in “• On-chip debug function”.
8	Pin Assignment	Added the pin assignment diagram of FPT-52P-M02.
10 to 13	Pin Functions	Added the pin numbers of FPT-52P-M02.
34	Electrical Characteristics AC Characteristics Clock Timing	Changed the values of clock frequency ( $F_{CRH}$ ).  Added conditions related to the LQFP package and the QFN package for the values of clock frequency ( $F_{CRH}$ ).  Added footnotes *2 and *3.
58 to 63	Sample Characteristics	Added “Sample Characteristics”.
65	Ordering Information	Added the part numbers of FPT-52P-M02.
67	Package Dimension	Added the package diagram of FPT-52P-M02.

**NOTE:** Please see “Document History” about later revised information.
