

# F<sup>2</sup>MC-16FX 16-Bit Microcontroller

MB96630 series is based on Cypress's advanced  $F^2MC-16FX$  architecture (16-bit with instruction pipeline for RISC-like performance). The CPU uses the same instruction set as the established  $F^2MC-16LX$  family thus allowing for easy migration of  $F^2MC-16LX$  Software to the new  $F^2MC-16FX$  products.

F<sup>2</sup>MC-16FX product improvements compared to the previous generation include significantly improved performance - even at the same operation frequency, reduced power consumption and faster start-up time.

For high processing speed at optimized power consumption an internal PLL can be selected to supply the CPU with up to 32MHz operation frequency from an external 4MHz to 8MHz resonator. The result is a minimum instruction cycle time of 31.2ns going together with excellent EMI behavior. The emitted power is minimized by the on-chip voltage regulator that reduces the internal CPU voltage. A flexible clock tree allows selecting suitable operation frequencies for peripheral resources independent of the CPU speed.

## **Features**

■Technology

0.18µm CMOS

#### **■**CPU

- □ F<sup>2</sup>MC-16FX CPU
- ☐ Optimized instruction set for controller applications (bit, byte, word and long-word data types, 23 different addressing modes, barrel shift, variety of pointers)
- □ 8-byte instruction queue
- □ Signed multiply (16-bit × 16-bit) and divide (32-bit/16-bit) instructions available

#### ■System clock

- □ On-chip PLL clock multiplier (×1 to ×8, ×1 when PLL stop)
- □ 4MHz to 8MHz crystal oscillator (maximum frequency when using ceramic resonator depends on Q-factor)
- □ Up to 8MHz external clock for devices with fast clock input feature
- □ 32.768kHz subsystem quartz clock
- □ 100kHz/2MHz internal RC clock for quick and safe startup, clock stop detection function, watchdog
- □ Clock source selectable from mainclock oscillator, subclock oscillator and on-chip RC oscillator, independently for CPU and 2 clock domains of peripherals
- ☐ The subclock oscillator is enabled by the Boot ROM program controlled by a configuration marker after a Power or External reset
- □ Low Power Consumption 13 operating modes (different Run, Sleep, Timer, Stop modes)
- ■On-chip voltage regulator

Internal voltage regulator supports a wide MCU supply voltage range (Min=2.7V), offering low power consumption

■Low voltage detection function

Reset is generated when supply voltage falls below programmable reference voltage

■Code Security

Protects Flash Memory content from unintended read-out

#### ■ DMA

Automatic transfer function independent of CPU, can be assigned freely to resources

## ■Interrupts

- □ Fast Interrupt processing
- □ 8 programmable priority levels
- □ Non-Maskable Interrupt (NMI)

#### ■CAN

- ☐ Supports CAN protocol version 2.0 part A and B
- □ ISO16845 certified
- ☐ Bit rates up to 1Mbps
- ☐ 32 message objects
- □ Each message object has its own identifier mask
- □ Programmable FIFO mode (concatenation of message objects)
- □ Maskable interrupt
- ☐ Disabled Automatic Retransmission mode for Time Triggered CAN applications
- □ Programmable loop-back mode for self-test operation

#### **■**USART

- □ Full duplex USARTs (SCI/LIN)
- □ Wide range of baud rate settings using a dedicated reload timer
- □ Special synchronous options for adapting to different synchronous serial protocols
- □ LIN functionality working either as master or slave LIN device
- ☐ Extended support for LIN-Protocol to reduce interrupt load

#### ■1<sup>2</sup>C

- □ Up to 400kbps
- ☐ Master and Slave functionality, 7-bit and 10-bit addressing

**Cypress Semiconductor Corporation**Document Number: 002-04719 Rev.\*A

#### ■A/D converter

- □ SAR-type
- □ 8/10-bit resolution
- □ Signals interrupt on conversion end, single conversion mode, continuous conversion mode, stop conversion mode, activation by software, external trigger, reload timers and PPGs
- □ Range Comparator Function
- □ Scan Disable Function

#### ■Source Clock Timers

Three independent clock timers (23-bit RC clock timer, 23-bit Main clock timer, 17-bit Sub clock timer)

#### ■ Hardware Watchdog Timer

- ☐ Hardware watchdog timer is active after reset
- □ Window function of Watchdog Timer is used to select the lower window limit of the watchdog interval

#### ■ Reload Timers

- □ 16-bit wide
- □ Prescaler with 1/2<sup>1</sup>, 1/2<sup>2</sup>, 1/2<sup>3</sup>, 1/2<sup>4</sup>, 1/2<sup>5</sup>, 1/2<sup>6</sup> of peripheral clock frequency
- □ Event count function

#### ■Free-Running Timers

- □ Signals an interrupt on overflow, supports timer clear upon match with Output Compare (0, 4)
- □ Prescaler with 1, 1/2<sup>1</sup>, 1/2<sup>2</sup>, 1/2<sup>3</sup>, 1/2<sup>4</sup>, 1/2<sup>5</sup>, 1/2<sup>6</sup>, 1/2<sup>7</sup>, 1/2<sup>8</sup> of peripheral clock frequency

#### ■Input Capture Units

- □ 16-bit wide
- □ Signals an interrupt upon external event
- □ Rising edge, Falling edge or Both (rising & falling) edges sensitive

#### ■Output Compare Units

- □ 16-bit wide
- □ Signals an interrupt when a match with Free-running Timer occurs
- □ A pair of compare registers can be used to generate an output signal

#### ■ Programmable Pulse Generator

- ☐ 16-bit down counter, cycle and duty setting registers
- ☐ Can be used as 2 x 8-bit PPG
- □ Interrupt at trigger, counter borrow and/or duty match
- □ PWM operation and one-shot operation
- □ Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock or of selected Reload timer underflow as clock input
- ☐ Can be triggered by software or reload timer
- ☐ Can trigger ADC conversion
- □ Timing point capture
- □ Start delay

#### ■ Quadrature Position/Revolution Counter (QPRC)

- □ Up/down count mode, Phase difference count mode, Count mode with direction
- □ 16-bit position counter
- □ 16-bit revolution counter
- ☐ Two 16-bit compare registers with interrupt
- □ Detection edge of the three external event input pins AIN, BIN and ZIN is configurable

#### ■ Real Time Clock

- □ Operational on main oscillation (4MHz), sub oscillation (32kHz) or RC oscillation (100kHz/2MHz)
- □ Capable to correct oscillation deviation of Sub clock or RC oscillator clock (clock calibration)
- □ Read/write accessible second/minute/hour registers
- □ Can signal interrupts every half second/second/minute/hour/day
- □ Internal clock divider and prescaler provide exact 1s clock

#### ■External Interrupts

- □ Edge or Level sensitive
- □ Interrupt mask bit per channel
- □ Each available CAN channel RX has an external interrupt for wake-up
- □ Selected USART channels SIN have an external interrupt for wake-up

#### ■ Non Maskable Interrupt

- ☐ Disabled after reset, can be enabled by Boot-ROM depending on ROM configuration block
- □ Once enabled, can not be disabled other than by reset
- ☐ High or Low level sensitive
- ☐ Pin shared with external interrupt 0

#### ■I/O Ports

- $\hfill\square$  Most of the external pins can be used as general purpose I/O
- □ All push-pull outputs (except when used as I<sup>2</sup>C SDA/SCL line)
- □ Bit-wise programmable as input/output or peripheral signal
- ☐ Bit-wise programmable input enable
- ☐ One input level per GPIO-pin (either Automotive or CMOS hysteresis)
- ☐ Bit-wise programmable pull-up resistor

#### ■Built-in On Chip Debugger (OCD)

- □ One-wire debug tool interface
- □ Break function:
  - · Hardware break: 6 points (shared with code event)
  - · Software break: 4096 points
- □ Event function
  - Code event: 6 points (shared with hardware break)
  - · Data event: 6 points
  - Event sequencer: 2 levels + reset
- □ Execution time measurement function
- ☐ Trace function: 42 branches
- □ Security function

#### ■Flash Memory

- □ Dual operation flash allowing reading of one Flash bank while programming or erasing the other bank
- □ Command sequencer for automatic execution of programming algorithm and for supporting DMA for programming of the Flash Memory
- ☐ Supports automatic programming, Embedded Algorithm
- □ Write/Erase/Erase-Suspend/Resume commands
- □ A flag indicating completion of the automatic algorithm
- ☐ Erase can be performed on each sector individually
- □ Sector protection
- ☐ Flash Security feature to protect the content of the Flash
- □ Low voltage detection during Flash erase or write

| Low Voltage Detection Function  |   | Yes  | Low voltage detection function can be disabled by software |   |
| Hardware W                      | Vatchdog Timer                                      |  | Yes  |   |
| On-chip RC                      |   |  | Yes  |   |
| On-chip Debugger                |   | Yes  |  |   |

## Note:

All signals of the peripheral function in each product cannot be allocated by limiting the pins of package.

It is necessary to use the port relocate function of the general I/O port according to your function use.

## 2. Block Diagram

## 3. Pin Assignment

(FPT-80P-M21)

Other than those above, general-purpose pins have only Automotive input level.

<sup>\*1:</sup> CMOS input level only

<sup>\*2:</sup> CMOS input level only for I<sup>2</sup>C

<sup>\*3:</sup> Please set ROM Configuration Block (RCB) to use the subclock.

# 4. Pin Description

| Pin name  | Feature               | Description  |
|-----------|-----------------------|--|
| ADTG      | ADC                   | A/D converter trigger input pin                                  |

<sup>\*1:</sup> For details about USER ROM area, see "User ROM Memory Map For Flash Devices" on the following pages.

GPR: General-Purpose Register

The DMA area is only available if the device contains the corresponding resource.

The available RAM and ROM area depends on the device.

 $<sup>\</sup>ensuremath{^{^{*2}}\!\!}$ : For RAMSTART Addresses, see the table on the next page.

 $<sup>^{*3}</sup>$ : Unused GPR banks can be used as RAM area.

## 8. RAMSTART Addresses

| Devices  | Bank 0<br>RAM size | RAMSTART0            |
|----------|--------------------|----------------------|
| MB96F633 | 10KB               | 00:5A00 <sub>н</sub> |
| MB96F635 | 16KB               | 00:4200 <sub>H</sub> |
| MB96F636 | 24KB               | 00:2200 <sub>H</sub> |
| MB96F637 | 28KB               | 00:1200 <sub>H</sub> |

# 9. User ROM Memory Map For Flash Devices

|  |  | MB96F633                    | MB96F635                     | MB96F636                         | MB96F637                     |                     |

<sup>\*:</sup> Physical address area of SAS-512B is from DF:0000 $_{\rm H}$  to DF:01FF $_{\rm H}$ . Others (from DF:0200 $_{\rm H}$  to DF:1FFF $_{\rm H}$ ) is mirror area of SAS-512B. Sector SAS contains the ROM configuration block RCBA at CPU address DF:0000 $_{\rm H}$ -DF:01FF $_{\rm H}$ . SAS can not be used for E $^2$ PROM emulation.

# 10. Serial Programming Communication Interface

USART pins for Flash serial programming (MD = 0, DEBUG I/F = 0, Serial Communication mode)

| MB96630    |              |                 |  |  |  |  |  |  |  |
|------------|--------------|-----------------|--|--|--|--|--|--|--|

## 12. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

#### 12.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

#### ■ Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

#### ■ Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

#### ■Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

- 1. Preventing Over-Voltage and Over-Current Conditions
  - Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.
- 2. Protection of Output Pins
  - Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.
- Handling of Unused Input Pins
  - Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

#### ■Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNPN junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- 1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
- 2. Be sure that abnormal current flows do not occur during the power-on sequence.

## ■Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

#### ■Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Page 27 of 69

#### ■Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

### 12.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

#### ■Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

#### ■Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

## ■Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

## ■ Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- 1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
  - When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- 3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- 4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

## ■Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

Document Number: 002-04719 Rev.\*A

#### ■Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- 1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
- 2. Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
  - Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- 4. Ground all fixtures and instruments, or protect with anti-static measures.
- 5. Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

## 12.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

- 1. Humidity
  - Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
- 2. Discharge of Static Electricity
  - When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
- 3. Corrosive Gases, Dust, or Oil
  - Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
- 4. Radiation, Including Cosmic Radiation
  - Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
- 5. Smoke, Flame
  - CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

Document Number: 002-04719 Rev.\*A

## 13. Handling Devices

## Special care is required for the following when handling the device:

- · Latch-up prevention
- · Unused pins handling
- · External clock usage
- · Notes on PLL clock mode operation
- Power supply pins (Vcc/Vss)
- · Crystal oscillator and ceramic resonator circuit
- Turn on sequence of power supply to A/D converter and analog inputs
- · Pin handling when not using the A/D converter
- · Notes on Power-on
- · Stabilization of power supply voltage
- · Serial communication
- Mode Pin (MD)

#### 13.1 Latch-up prevention

CMOS IC chips may suffer latch-up under the following conditions:

- A voltage higher than V<sub>CC</sub> or lower than V<sub>SS</sub> is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between V<sub>cc</sub> pins and V<sub>ss</sub> pins.
- The AV<sub>CC</sub> power supply is applied before the V<sub>CC</sub> voltage.

Latch-up may increase the power supply current dramatically, causing thermal damages to the device.

For the same reason, extra care is required to not let the analog power-supply voltage (AV<sub>CC</sub>, AVRH) exceed the digital power-supply voltage.

#### 13.2 Unused pins handling

Unused input pins can be left open when the input is disabled (corresponding bit of Port Input Enable register PIER = 0).

Leaving unused input pins open when the input is enabled may result in misbehavior and possible permanent damage of the device. To prevent latch-up, they must therefore be pulled up or pulled down through resistors which should be more than  $2k\Omega$ .

Unused bidirectional pins can be set either to the output state and be then left open, or to the input state with either input disabled or external pull-up/pull-down resistor as described above.

#### 13.3 External clock usage

The permitted frequency range of an external clock depends on the oscillator type and configuration.

See AC Characteristics for detailed modes and frequency limits. Single and opposite phase external clocks must be connected as follows:

#### 13.3.1 Single phase external clock for Main oscillator

When using a single phase external clock for the Main oscillator, X0 pin must be driven and X1 pin left open. And supply 1.8V power to the external clock.

#### 13.3.2 Single phase external clock for Sub oscillator

When using a single phase external clock for the Sub oscillator, "External clock mode" must be selected and X0A/P04\_0 pin must be driven. X1A/P04\_1 pin can be configured as GPIO.

#### 13.3.3 Opposite phase external clock

When using an opposite phase external clock, X1 (X1A) pins must be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. Supply level on X0 and X1 pins must be 1.8V.

#### 13.4 Notes on PLL clock mode operation

If the microcontroller is operated with PLL clock mode and no external oscillator is operating or no external clock is supplied, the microcontroller attempts to work with the free oscillating PLL. Performance of this operation, however, cannot be guaranteed.

#### 13.5 Power supply pins (V<sub>cc</sub>/V<sub>ss</sub>)

It is required that all  $V_{CC}$ -level as well as all  $V_{SS}$ -level power supply pins are at the same potential. If there is more than one  $V_{CC}$  or  $V_{SS}$  level, the device may operate incorrectly or be damaged even within the guaranteed operating range.

V<sub>cc</sub> and V<sub>ss</sub> pins must be connected to the device from the power supply with lowest possible impedance.

The smoothing capacitor at V<sub>cc</sub> pin must use the one of a capacity value that is larger than C<sub>s</sub>.

Besides this, as a measure against power supply noise, it is required to connect a bypass capacitor of about  $0.1\mu F$  between  $V_{cc}$  and  $V_{ss}$  pins as close as possible to  $V_{cc}$  and  $V_{ss}$  pins.

## 13.6 Crystal oscillator and ceramic resonator circuit

Noise at X0, X1 pins or X0A, X1A pins might cause abnormal operation. It is required to provide bypass capacitors with shortest possible distance to X0, X1 pins and X0A, X1A pins, crystal oscillator (or ceramic resonator) and ground lines, and, to the utmost effort, that the lines of oscillation circuit do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0, X1 pins and X0A, X1A pins with a ground area for stabilizing the operation.

It is highly recommended to evaluate the quartz/MCU or resonator/MCU system at the quartz or resonator manufacturer, especially when using low-Q resonators at higher frequencies.

### 13.7 Turn on sequence of power supply to A/D converter and analog inputs

It is required to turn the A/D converter power supply (AV<sub>CC</sub>, AVRH) and analog inputs (ANn) on after turning the digital power supply (V<sub>CC</sub>) on.

It is also required to turn the digital power off after turning the A/D converter supply and analog inputs off. In this case, AVRH must not exceed  $AV_{CC}$ . Input voltage for ports shared with analog input ports also must not exceed  $AV_{CC}$  (turning the analog and digital power supplies simultaneously on or off is acceptable).

## 13.8 Pin handling when not using the A/D converter

If the A/D converter is not used, the power supply pins for A/D converter should be connected such as  $AV_{CC} = V_{CC}$ ,  $AV_{SS} = AVRH = V_{SS}$ .

#### 13.9 Notes on Power-on

To prevent malfunction of the internal voltage regulator, supply voltage profile while turning the power supply on should be slower than 50µs from 0.2V to 2.7V.

#### 13.10Stabilization of power supply voltage

If the power supply voltage varies acutely even within the operation safety range of the  $V_{CC}$  power supply voltage, a malfunction may occur. The  $V_{CC}$  power supply voltage must therefore be stabilized. As stabilization guidelines, the power supply voltage must be stabilized in such a way that  $V_{CC}$  ripple fluctuations (peak to peak value) in the commercial frequencies (50Hz to 60Hz) fall within 10% of the standard  $V_{CC}$  power supply voltage and the transient fluctuation rate becomes  $0.1V/\mu s$  or less in instantaneous fluctuation for power supply switching.

## 13.11 Serial communication

There is a possibility to receive wrong data due to noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider receiving of wrong data when designing the system. For example apply a checksum and retransmit the data if an error occurs.

### 13.12Mode Pin (MD)

Connect the mode pin directly to Vcc or Vss pin. To prevent the device unintentionally entering test mode due to noise, lay out the printed circuit board so as to minimize the distance from the mode pin to Vcc or Vss pin and provide a low-impedance connection.

## 14. Electrical Characteristics

### 14.1 Absolute Maximum Ratings

<sup>&</sup>lt;sup>\*1</sup>: This parameter is based on Vss = AVss = 0V.

- · Use within recommended operating conditions.
- Use at DC voltage (current).
- The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
- The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V<sub>CC</sub> pin, and this may affect other devices.
- Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0V), the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the Power reset.

<sup>\*2:</sup> AVcc and Vcc must be set to the same voltage. It is required that AVcc does not exceed Vcc and that the voltage at the analog inputs does not exceed AVcc when the power is switched on.

<sup>\*3:</sup> VI and Vo should not exceed Vcc + 0.3V. VI should also not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the ICLAMP rating supersedes the VI rating. Input/Output voltages of standard ports depend on Vcc.

<sup>\*4:</sup> Applicable to all general purpose I/O pins (Pnn\_m).

 The DEBUG I/F pin has only a protective diode against V<sub>SS</sub>. Hence it is only permitted to input a negative clamping current (4mA). For protection against positive input voltages, use an external clamping diode which limits the input voltage to maximum 6.0V.

• Sample recommended circuits:

<sup>\*5:</sup> The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.

The actual power dissipation depends on the customer application and can be calculated as follows:

 $P_D = P_{IO} + P_{INT}$ 

 $P_{IO}$  =  $\Sigma$  ( $V_{OL} \times I_{OL} + V_{OH} \times I_{OH}$ ) (I/O load power dissipation, sum is performed on all I/O ports)

 $P_{INT} = V_{CC} \times (I_{CC} + I_A)$  (internal power dissipation)

 $I_{CC}$  is the total core current consumption into  $V_{CC}$  as described in the "DC characteristics" and depends on the selected operation mode and clock frequency and the usage of functions like Flash programming.

I<sub>A</sub> is the analog current consumption into AV<sub>CC</sub>.

#### **WARNING**

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

<sup>&</sup>lt;sup>\*6</sup>: Worst case value for a package mounted on single layer PCB at specified T<sub>A</sub> without air flow.

<sup>&</sup>lt;sup>\*7</sup>: Write/erase to a large sector in flash memory is warranted with TA ≤ + 105°C.

## 14.2 Recommended Operating Conditions

## **WARNING**

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

<sup>\*1:</sup> The power supply current is measured with a 4MHz external clock connected to the Main oscillator and a 32kHz external clock connected to the Sub oscillator. See chapter "Standby mode and voltage regulator control circuit" of the Hardware Manual for further details about voltage regulator control. Current for "On Chip Debugger" part is not included. Power supply current in Run mode does not include Flash Write / Erase current.

The power supply current is measured with a 4MHz external clock connected to the Main oscillator and a 32kHz external clock connected to the Sub oscillator. The current for "On Chip Debugger" part is not included.

When Flash is not in Power-down / reset mode, I<sub>CCFLASHPD</sub> must be added to the Power supply current.

<sup>\*2:</sup> The power supply current in Timer mode is the value when Flash is in Power-down / reset mode.

When Flash is not in Power-down / reset mode, I<sub>CCFLASHPD</sub> must be added to the Power supply current.

<sup>\*3:</sup> The power supply current in Stop mode is the value when Flash is in Power-down / reset mode.

<sup>\*4:</sup> When low voltage detector is enabled, I<sub>CCLVD</sub> must be added to Power supply current.

<sup>&</sup>lt;sup>\*5</sup>: When Flash Write / Erase program is executed, I<sub>CCFLASH</sub> must be added to Power supply current.

# Notes:

- · AC characteristic in CLK synchronized mode.
- C<sub>L</sub> is the load capacity value of pins when testing.
- Depending on the used machine clock frequency, the maximum possible baud rate can be limited by some parameters. These parameters are shown in "MB96600 series HARDWARE MANUAL".
- t<sub>CLKP1</sub> indicates the peripheral clock 1 (CLKP1), Unit: ns
- These characteristics only guarantee the same relocate port number.
   For example, the combination of SCKn and SOTn\_R is not guaranteed.
- \*: Parameter N depends on t<sub>SCYC</sub> and can be calculated as follows:
  - If  $t_{SCYC} = 2 \times k \times t_{CLKP1}$ , then N = k, where k is an integer > 2
  - If  $t_{SCYC} = (2 \times k + 1) \times t_{CLKP1}$ , then N = k + 1, where k is an integer > 1

#### Examples:

| tscyc                                    | N |
|--|---|
| 4 × t <sub>CLKP1</sub>                   | 2 |
| $5 \times t_{CLKP1}, 6 \times t_{CLKP1}$ | 3 |
| $7 \times t_{CLKP1}, 8 \times t_{CLKP1}$ | 4 |
|  |   |

<sup>\*:</sup> Time for each channel.

#### 14.5.2 Accuracy and Setting of the A/D Converter Sampling Time

If the external impedance is too high or the sampling time too short, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting the A/D conversion precision.

To satisfy the A/D conversion precision, a sufficient sampling time must be selected. The required sampling time (Tsamp) depends on the external driving impedance R<sub>ext</sub>, the board capacitance of the A/D converter input pin C<sub>ext</sub> and the AV<sub>CC</sub> voltage level. The following replacement model can be used for the calculation:

Rext: External driving impedance

Cext: Capacitance of PCB at A/D converter input

C<sub>VIN</sub>: Analog input capacity (I/O, analog switch and ADC are contained) R<sub>VIN</sub>: Analog input impedance (I/O, analog switch and ADC are contained)

The following approximation formula for the replacement model above can be used: Tsamp =  $7.62 \times (Rext \times Cext + (Rext + R_{VIN}) \times C_{VIN})$ 

• Do not select a sampling time below the absolute minimum permitted value. (0.5 $\mu$ s for 4.5V  $\leq$  AV<sub>CC</sub>  $\leq$  5.5V, 1.2 $\mu$ s for 2.7V  $\leq$  AV<sub>CC</sub> < 4.5V)

- If the sampling time cannot be sufficient, connect a capacitor of about 0.1μF to the analog input pin.
- A big external driving impedance also adversely affects the A/D conversion precision due to the pin input leakage current IIL (static current before the sampling switch) or the analog input leakage current IAIN (total leakage current of pin input and comparator during sampling). The effect of the pin input leakage current IIL cannot be compensated by an external capacitor.
- The accuracy gets worse as |AVRH AVSS| becomes smaller.

#### 14.5.3 Definition of A/D Converter Terms

• Resolution : Analog variation that is recognized by an A/D converter.

• Nonlinearity error : Deviation of the actual conversion characteristics from a straight line that connects the zero

transition point (0b0000000000  $\longleftrightarrow$  0b0000000001) to the full-scale transition point

 $(0b11111111110 \longleftrightarrow 0b1111111111).$ 

• Differential nonlinearity error : Deviation from the ideal value of the input voltage that is required to change the

output code by 1LSB.

• Total error : Difference between the actual value and the theoretical value. The total error includes zero

transition error, full-scale transition error and nonlinearity error.

• Zero transition voltage : Input voltage which results in the minimum conversion value.

• Full scale transition voltage: Input voltage which results in the maximum conversion value.

: Voltage at which the digital output changes from 0x(N - 1) to 0xN.

 $V_{NT}$ 

1LSB (Ideal value) = 
$$\frac{AVRH - AV_{SS}}{1024}$$
 [V]

Total error of digital output N = 
$$\frac{V_{NT} - \{1LSB \times (N-1) + 0.5LSB\}}{1LSB}$$

N : A/D converter digital output value.

 $V_{NT}$ : Voltage at which the digital output changes from 0x(N + 1) to 0xN.

V<sub>OT</sub> (Ideal value) = AV<sub>SS</sub> + 0.5LSB[V] V<sub>FST</sub> (Ideal value) = AVRH - 1.5LSB[V]

| Detection delay time                          | t <sub>d</sub>       | -                             | -       | -     | 30      | μS   |

<sup>\*1:</sup> If the power supply voltage fluctuates within the time less than the detection delay time (t<sub>d</sub>), there is a possibility that the low voltage detection will occur or stop after the power supply voltage passes the detection range.

<sup>&</sup>lt;sup>\*2</sup>: In order to perform the low voltage detection at the detection voltage (V<sub>DLX</sub>), be sure to suppress fluctuation of the power supply voltage within the limits of the change ration of power supply voltage.

## 14.7 Flash Memory Write/Erase Characteristics

 $(V_{CC} = AV_{CC} = 2.7V \text{ to } 5.5V, V_{SS} = AV_{SS} = 0V, T_A = -40^{\circ}C \text{ to } + 125^{\circ}C)$

#### Note:

While the Flash memory is written or erased, shutdown of the external power ( $V_{CC}$ ) is prohibited. In the application system where the external power ( $V_{CC}$ ) might be shut down while writing or erasing, be sure to turn the power off by using a low voltage detection function.

To put it concrete, change the external power in the range of change ration of power supply voltage (-0.004V/ $\mu$ s to +0.004V/ $\mu$ s) after the external power falls below the detection voltage ( $V_{DLX}$ )<sup>-1</sup>.

Write/Erase cycles and data hold time

| Write/Erase cycles (cycle) | Data hold time<br>(year) |
|----------------------------|--------------------------|
| 1,000                      | 20 *2                    |
| 10,000                     | 10 *2                    |
| 100,000                    | 5 *2                     |

<sup>\*1:</sup> See "Low Voltage Detection Function Characteristics".

<sup>\*2:</sup> This value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at + 85°C).

# 15. Example Characteristics

This characteristic is an actual value of the arbitrary sample. It is not the guaranteed value.

|          | 1. Absolute Maximum Ratings      | Note that if the +B input is applied during power-on, the power supply  |
|          |                                  | is provided from the pins and the resulting supply voltage may not be   |
| 33       |                                  | sufficient to operate the Power reset (except devices with persistent low voltage reset in internal vector mode). |
|          |                                  | → Note that if the +B input is applied during power-on, the power supply  |
|          |                                  | is provided from the pins and the resulting supply voltage may not be   |
|          |                                  | sufficient to operate the Power reset.  |
|          | Absolute Maximum Ratings         | Added the annotation *4  The DEBUG I/F pin has only a protective diode against V <sub>SS</sub> . Hence it         |
| 33       |                                  | is only permitted to input a negative clamping current (4mA). For   |
|          |                                  | protection against positive input voltages, use an external clamping  |
|          | Recommended Operating Conditions | diode which limits the input voltage to maximum 6.0V.  Added the Value and Remarks to "Power supply voltage"      |
|          |                                  | Min: 2.0V   |
|          |                                  | Typ: -  |
|          |                                  | Max: 5.5V Remarks: Maintains RAM data in stop mode  |
| 35       |                                  | Changed the Value of "Smoothing capacitor at C pin"   |
|          |                                  | Typ: $1.0\mu F \rightarrow 1.0\mu F$ to $3.9\mu F$  |
|          |                                  | Max: $1.5\mu F \rightarrow 4.7\mu F$  |
|          |                                  | Changed the Remarks of "Smoothing capacitor at C pin" Deleted "(Target value)"                                    |
|          |                                  | Added "3.9μF (Allowance within ± 20%)"  |

| Page | Section               | Change Results  |
|------|-----------------------|---|
|      | 3. DC Characteristics | Deleted "(Target value)" from Remarks   |
|      | (1) Current Rating    | Added the Symbol to "Power supply current in Run modes"   |
|      |                       | I <sub>CCRCH</sub> , I <sub>CCRCL</sub>   |
|      |                       | Changed the Conditions of I <sub>CCPLL</sub> , I <sub>CCMAIN</sub> , I <sub>CCSUB</sub> in "Power supply              |
|      |                       | current in Run modes"  "Flash 0 wait" is added  |
|      |                       | Changed the Value of "Power supply current in Run modes"  |
| 00   |                       | Iccell  |
| 36   |                       | Max: 37.5mA $\rightarrow$ 37mA (T <sub>A</sub> = +105°C)  |
|      |                       | Max: $39\text{mA} \rightarrow 38.5\text{mA} (T_A = +125^{\circ}\text{C})$   |
|      |                       | I <sub>CCMAIN</sub>   |
|      |                       | Max: 9mA $\rightarrow$ 8mA (T <sub>A</sub> = +105°C)  |
|      |                       | Max: $10.5\text{mA} \rightarrow 9.5\text{mA} \text{ (T}_A = +125^{\circ}\text{C)}$                                    |
|      |                       | Max: $6mA \rightarrow 3.3mA (T_A = +105^{\circ}C)$  |
|      |                       | Max: $7.5\text{mA} \rightarrow 4.8\text{mA}$ ( $T_A = +125^{\circ}\text{C}$ )   |
|      |                       | Added the Symbol to "Power supply current in Sleep modes"   |
|      |                       | Iccsrch, Iccsrcl  |
|      |                       | Changed the Conditions of I <sub>CCSMAIN</sub> in "Power supply current in Sleep                                      |
|      |                       | modes"  |
|      |                       | "SMCR:LPMSS=0" is added Changed the Value of "Power supply current in Sleep modes"                                    |
|      |                       | Iccspll   |
|      |                       | Typ: $10\text{mA} \rightarrow 8.5\text{mA} (T_A = +25^{\circ}\text{C})$   |
| 37   |                       | Max: $15mA \rightarrow 14mA (T_A = +105^{\circ}C)$  |
|      |                       | Max : 16.5mA $\rightarrow$ 15.5mA (T <sub>A</sub> = +125°C)   |
|      |                       | I <sub>CCSMAIN</sub>  |
|      |                       | Max: $7mA \rightarrow 4.5m A (T_A = +105^{\circ}C)$   |
|      |                       | $Max: 8.5mA \rightarrow 6mA (T_A = +125^{\circ}C)$  |
|      |                       | $I_{CCSSUB}$<br>Typ: 0.08mA $\rightarrow$ 0.04m A ( $T_A = +25^{\circ}$ C)  |
|      |                       | Max: $4\text{mA} \rightarrow 2.5\text{m A}$ ( $T_A = +105^{\circ}\text{C}$ )  |
|      |                       | $Max: 5.5mA \rightarrow 4mA (T_A = +125°C)$   |
|      |                       | Added the Symbol to "Power supply current in Timer modes"   |
|      |                       | I <sub>CCTPLL</sub>   |
|      |                       | Changed the Conditions of I <sub>CCTMAIN</sub> , I <sub>CCTRCH</sub> in "Power supply current in                      |
|      |                       | Timer modes" "SMCR:LPMSS=0" is added  |
|      |                       | Changed the Value of "Power supply current in Timer modes"  |
|      |                       | I <sub>CCTMAIN</sub>  |
|      |                       | Max: $355\mu A \rightarrow 330\mu A (T_A = +25^{\circ}C)$   |
|      |                       | Max: $1300\mu A \rightarrow 1195\mu A (T_A = +105^{\circ}C)$  |
|      |                       | Max: $2310\mu A \rightarrow 2165\mu A (T_A = +125^{\circ}C)$  |
| 38   |                       | ICCTRCH   |
|      |                       | Max: 245μA → 215μA ( $T_A = +25$ °C) Max: 1215μA → 1095μA ( $T_A = +105$ °C)  |
|      |                       | Max: $2215\mu A \rightarrow 1095\mu A (T_A = +105 C)$<br>Max: $2215\mu A \rightarrow 2075\mu A (T_A = +125^{\circ}C)$ |
|      |                       | IcctrcL   |
|      |                       | Max: 105μA → 75μA (T <sub>A</sub> = +25°C)  |
|      |                       | Max: $1010\mu A \rightarrow 905\mu A (T_A = +105^{\circ}C)$   |
|      |                       | Max: $2015\mu A \rightarrow 1880\mu A (T_A = +125^{\circ}C)$  |
|      |                       | ICCTSUB   |
|      |                       | Max: $90\mu A \rightarrow 65\mu A$ ( $T_A = +25^{\circ}C$ )   |
|      |                       | Max: $985\mu A \rightarrow 885\mu A$ ( $T_A = +105^{\circ}C$ )  |
|      |                       | Max: $1990\mu A \rightarrow 1850\mu A (T_A = +125^{\circ}C)$  |

| Page | Section                                   | Change Results  |
|------|---|---|
|      | DC Characteristics     (1) Current Rating | Changed the Value of "Power supply current in Stop modes" $I_{CCH}$ Max: $90\mu A \rightarrow 60\mu A$ ( $T_A = +25^{\circ}C$ ) Max: $985\mu A \rightarrow 880\mu A$ ( $T_A = +105^{\circ}C$ ) Max: $1985\mu A \rightarrow 1845\mu A$ ( $T_A = +125^{\circ}C$ ) |
|      |   | Added the Symbol  |
|      |   | Changed the Value and condition of "Power supply current for active Low Voltage detector"  ICCLVD   |
|      |   | Typ: 5μA, Max: 15μA, Remarks: nothing  → Typ: 5μA, Max: -, Remarks: T <sub>A</sub> = +25°C  |
|      |   | Typ: -, Max: 12.5µA, Remarks: T <sub>A</sub> = +125°C   |
| 39   |   | Changed the condition of "Flash Write/Erase current"  IccFLASH  Time 12 Fm A May 20m A Removies nothing   |
|      |   | Typ: 12.5mA, Max: 20mA, Remarks: nothing  →   |
|      |   | Typ: 12.5mA, Max: -, Remarks: T <sub>A</sub> = +25°C<br>Typ: -, Max: 20mA, Remarks: T <sub>A</sub> = +125°C   |
|      |   | Changed the annotation *2   |
|      |   | The power supply current is measured with a 4MHz external clock connected to the Main oscillator and a 32kHz external clock connected to the Sub oscillator.  |
|      |   | → When Flash is not in Power-down / reset mode, I <sub>CCFLASHPD</sub> must be added to the Power supply current.   |
|      |   | The power supply current is measured with a 4MHz external clock connected to the Main oscillator and a 32kHz external clock   |
|      |   | connected to the Sub oscillator. The current for "On Chip Debugger" part is not included.   |
| 40   | 3. DC Characteristics                     | Added the Symbol for DEBUG I/F pin  |
| 40   | (2) Pin Characteristics                   | V <sub>OLD</sub>  |
|      |   | Changed the Pin name of "Input capacitance"  Other than   |
|      |   | Vcc,  |
|      |   | Vss,<br>AVcc.   |
|      |   | AVCC,<br>AVss.  |
|      |   | AVRH  |
| 41   |   | → Other than  |
| 71   |   | C,  |
|      |   | Vcc,  |
|      |   | Vss,<br>AVcc,   |
|      |   | AVSS,   |
|      |   | AVRH  |
|      |   | Deleted the annotation  "I <sub>OH</sub> and I <sub>OL</sub> are target value."   |
|      | 4. AC Characteristics                     | Changed MAX frequency for f <sub>FCI</sub> in all conditions  |
|      | (1) Main Clock Input Characteristics      | 16→8  |
| 42   |   | Changed MIN frequency for t <sub>CYLH</sub> 62.5→125  |
|      |   | Changed MIN, MAX and Unit for P <sub>WH</sub> , P <sub>WL</sub>   |
|      |   | MIN: 30→55  |
|      |   | MAX: 70→-   |
|      |   | Unit: %→ns Added the figure (t <sub>CYLH</sub> ) when using the external clock  |
| 43   | 4. AC Characteristics                     |   |
| 40   | (2) Sub Clock Input Characteristics       | Added the figure (t <sub>CYLL</sub> ) when using the crystal oscillator clock   |

| Page | Section   | Change Results   |
|------|---|--|
| 44   | 4. AC Characteristics     (3) Built-In RC Oscillation Characteristics | Added "RC clock stabilization time"  |
|      | 4. AC Characteristics     (5) Operating Conditions Of PLL             | Changed the Value of "PLL input clock frequency" Max: 16MHz → 8MHz   |
|      |   | Changed the Symbol of "PLL oscillation clock frequency" $f_{\text{PLLO}} \rightarrow f_{\text{CLKVCO}}$                              |
| 45   |   | Added Remarks to "PLL oscillation clock frequency"   |
|      | 4. Ac Characteristics   | Added "PLL phase jitter" and the figure  |
|      | (6) Reset Input   | Added the figure for reset input time (t <sub>RSTL</sub> )   |
|      | 4. Ac Characteristics     (8) Usart Timing                            | Changed the condition (VCC = AVCC = 2.7V to 5.5V, VSS = AVSS = 0V, TA = -40°C to + 105°C)  A   |
| 47   |   | $(V_{CC} = AV_{CC} = 2.7V \text{ to } 5.5V, V_{SS} = AV_{SS} = 0V, T_A = -40^{\circ}\text{C to } + 125^{\circ}\text{C}, C_L = 50pF)$ |
|      |   | Changed the HARDWARE MANUAL  |
|      |   | "MB96630 series HARDWARE MANUAL"   |
|      |   | "MB96600 series HARDWARE MANUAL"   |
| 48   |   | Changed the figure for "Internal shift clock mode"   |
| 50   | 4. AC Characteristics   | Added parameter, "Noise filter" and an annotation *5 for it  |
| -    | (10) I <sup>2</sup> C Timing  | Added t <sub>SP</sub> to the figure  |
|      | 5. A/D Converter (1) Electrical Characteristics For The A/D           | Added "Analog impedance"   |
| 51   | Converter   | Added "Variation between channels"   |
|      | 5. A/D Converter  | Added the annotation  Deleted the unit "[Min]" from approximation formula of Sampling time   |
| 52   | (2) Accuracy And Setting Of The A/D Converter Sampling Time           | Deleted the drift [Mill] from approximation formula of Gampling time   |
|      | 5. A/D Converter  | Changed the Description and the figure   |
|      | (3) Definition Of A/D Converter Terms                                 | "Linearity"   "Nonlinearity"  "Differential linearity over"  |
|      |   | "Differential linearity error" →   |
|      |   | "Differential nonlinearity error"  |
|      |   | Changed the Description  |
|      |   | Linearity error:   |
|      |   | Deviation of the line between the zero-transition point (0b0000000000 ←→0b000000001) and the full-scale transition point             |
|      |   | (0b1111111110 $\leftarrow$ $\rightarrow$ 0b1111111111) from the actual conversion  |
| 53   |   | characteristics.   |
|      |   | → Nonlinearity error:  |
|      |   | Deviation of the actual conversion characteristics from a straight line  |
|      |   | that connects the zero transition point (0b000000000 $\longleftrightarrow$   |
|      |   | 0b0000000001) to the full-scale transition point (0b11111111110 $\longleftrightarrow$ 0b1111111111).                                 |
|      |   | Added the Description  |
|      |   | "Zero transition voltage"  |
|      |   | "Full scale transition voltage"  |
|      | Low Voltage Detection Function     Characteristics                    | Added the Value of "Power supply voltage change rate"  Max: +0.004 V/μs  |
|      | Characteristics   | Added "Hysteresis width" (V <sub>HYS</sub> )   |
| 55   |   | Added "Stabilization time" (T <sub>LVDSTAB</sub> )   |
|      |   | Added "Detection delay time" (t <sub>d</sub> )   |
|      |   | Deleted the Remarks  |
|      |   | Added the annotation *1, *2  |
| 56   |   | Added the figure for "Hysteresis width"  |
| 50   |   | Added the figure for "Stabilization time"  |

| Page         | Section                                     | Change Results  |  |  |
|--------------|---|---|--|--|
|              | 7. Flash Memory Write/Erase Characteristics | Changed the Value of "Sector erase time"                                  |  |  |
|              |   | Added "Security Sector" to "Sector erase time"                            |  |  |
|              |   | Changed the Parameter   |  |  |
|              |   | "Half word (16 bit) write time"   |  |  |
|              |   | → ((a) (b) (b) (b) (b) (b) (b) (b) (c) (c) (c) (c) (c) (c) (c) (c) (c) (c |  |  |
|              |   | "Word (16-bit) write time"  |  |  |
| 57           |   | Changed the Value of "Chip erase time"                                    |  |  |
|              |   | Changed the Remarks of "Sector erase time"                                |  |  |
|              |   | Excludes write time prior to internal erase                               |  |  |
|              |   | Includes write time prior to internal erase                               |  |  |
|              |   | Added the Note and annotation *1  |  |  |
|              |   | Deleted "(targeted value)" from title "Write/Erase cycles and data hold   |  |  |
|              |   | time"   |  |  |
| 58 to 60     | Example Characteristics                     | Added a section   |  |  |
