

The MB9B310T Series are highly integrated 32-bit microcontrollers dedicated for embedded controllers with high-performance and competitive cost.

These series are based on the ARM<sup>®</sup> Cortex<sup>®</sup>-M3 Processor with on-chip Flash memory and SRAM, and has peripheral functions such as Motor Control Timers, ADCs and Communication Interfaces (USB, UART, CSIO, I<sup>2</sup>C, LIN).

The products which are described in this data sheet are placed into TYPE2 product categories in "FM3 Family Peripheral Manual".

## Features

### 32-bit ARM<sup>®</sup> Cortex<sup>®</sup>-M3 Core

- Processor version: r2p1
- Up to 144 MHz Frequency Operation
- Memory Protection Unit (MPU): improves the reliability of an embedded system
- Integrated Nested Vectored Interrupt Controller (NVIC): 1 NMI (non-maskable interrupt) and 48 peripheral interrupts and 16 priority levels
- 24-bit System timer (Sys Tick): System timer for OS task management

### On-chip Memories

#### [Flash memory]

- Up to 1 Mbyte
  - Built-in Flash Accelerator System with 16 Kbyte trace buffer memory
- The read access to Flash memory can be achieved without wait cycle up to operation frequency of 72MHz. Even at the operation frequency more than 72MHz, an equivalent access to Flash memory can be obtained by Flash Accelerator System.
- Security function for code protection

#### [SRAM]

This Series contain a total of up to 128Kbyte on-chip SRAM memories. This is composed of two independent SRAM (SRAM0, SRAM1). SRAM0 is connected to I-code bus and D-code bus of Cortex-M3 core. SRAM1 is connected to System bus.

- SRAM0: Up to 64 Kbyte.
- SRAM1: Up to 64 Kbyte.

### External Bus Interface

- Supports SRAM, NOR and NAND Flash device
- Up to 8 chip selects
- 8-/16-bit Data width
- Up to 25-bit Address bit
- Maximum area size: Up to 256 Mbytes
- Supports Address/Data multiplex
- Supports external RDY input

### USB Interface (Max 2 channels)

USB interface is composed of Function and Host.

#### [USB function]

- USB2.0 Full-Speed supported
- Max 6 EndPoint supported
  - EndPoint 0 is control transfer
  - EndPoint 1, 2 can be selected Bulk-transfer, Interrupt-transfer or Isochronous-transfer
  - EndPoint 3 to 5 can be selected Bulk-transfer or Interrupt-transfer
  - EndPoint 1 to 5 is comprised Double Buffer
    - EndPoint 0, 2 to 5: 64 bytes
    - EndPoint 1: 256 bytes

#### [USB host]

- USB2.0 Full/Low speed supported
- Bulk-transfer, interrupt-transfer and Isochronous-transfer support
- USB Device connected/dis-connected automatically detect
- IN/OUT token handshake packet automatically
- Max 256-byte packet-length supported
- Wake-up function supported

## Multi-function Serial Interface (Max 8 channels)

- 4 channels with 16steps×9-bit FIFO (ch.4 to ch.7), 4 channels without FIFO (ch.0 to ch.3)
- Operation mode is selectable from the followings for each channel.
  - UART
  - CSIO
  - LIN
  - I<sup>2</sup>C

### [UART]

- Full-duplex double buffer
- Selection with or without parity supported
- Built-in dedicated baud rate generator
- External clock available as a serial clock
- Hardware Flow control : Automatically control the transmission by CTS/RTS (only ch.4)
- Various error detect functions available (parity errors, framing errors, and overrun errors)

### [CSIO]

- Full-duplex double buffer
- Built-in dedicated baud rate generator
- Overrun error detect function available

### [LIN]

- LIN protocol Rev.2.1 supported
- Full-duplex double buffer
- Master/Slave mode supported
- LIN break field generate (can be changed 13 to 16-bit length)
- LIN break delimiter generate (can be changed 1 to 4-bit length)
- Various error detect functions available (parity errors, framing errors, and overrun errors)

### [I<sup>2</sup>C]

- Standard-mode (Max 100 kbps) / Fast-mode (Max 400 kbps) supported

## DMA Controller (8channels)

DMA Controller has an independent bus for CPU, so CPU and DMA Controller can process simultaneously.

- 8 independently configured and operated channels
- Transfer can be started by software or request from the built-in peripherals
- Transfer address area: 32-bit (4 Gbyte)
- Transfer mode: Block transfer/Burst transfer/Demand transfer
- Transfer data type: byte/half-word/word
- Transfer block count: 1 to 16
- Number of transfers: 1 to 65536

## A/D Converter (Max 32 channels)

### [12-bit A/D Converter]

- Successive Approximation Register type
- Built-in 3units
- Conversion time: 1.0 μs@ 5 V
- Priority conversion available (priority at 2 levels)
- Scanning conversion mode
- Built-in FIFO for conversion data storage (for SCAN conversion: 16 steps, for Priority conversion: 4 steps)

## Base Timer (Max 16 channels)

Operation mode is selectable from the followings for each channel.

- 16-bit PWM timer
- 16-bit PPG timer
- 16-/32-bit reload timer
- 16-/32-bit PWC timer

## General Purpose I/O Port

This series can use its pins as I/O ports when they are not used for external bus or peripherals. Moreover, the port relocate function is built in. It can set which I/O port the peripheral function can be allocated.

- Capable of pull-up control per pin
- Capable of reading pin level directly
- Built-in the port relocate function
- Up 154 fast I/O Ports@ 176 pin Package
- Some pin is 5V tolerant I/O.  
See "Pin Description" to confirm the corresponding pins.

## Multi-function Timer (Max 3 units)

The Multi-function timer is composed of the following blocks.

- 16-bit free-run timer × 3ch./unit
- Input capture × 4ch./unit
- Output compare × 6ch./unit
- A/D activation compare × 3ch./unit
- Waveform generator × 3ch./unit
- 16-bit PPG timer × 3ch./unit

The following function can be used to achieve the motor control.

- PWM signal output function
- DC chopper waveform output function
- Dead time function
- Input capture function
- A/D convertor activate function
- DTIF (Motor emergency stop) interrupt function

## Quadrature Position/Revolution Counter (QPRC) (Max 3 channels)

The Quadrature Position/Revolution Counter (QPRC) is used to measure the position of the position encoder. Moreover, it is possible to use up/down counter.

- The detection edge of the three external event input pins AIN, BIN and ZIN is configurable.
- 16-bit position counter
- 16-bit revolution counter
- Two 16-bit compare registers

## Dual Timer (32-/16-bit Down Counter)

The Dual Timer consists of two programmable 32-/16-bit down counters.

Operation mode is selectable from the followings for each channel.

- Free-running
- Periodic (=Reload)
- One-shot

## Watch Counter

The Watch counter is used for wake up from power saving mode.

Interval timer: up to 64s (Max) @ Sub Clock: 32.768 kHz

## External Interrupt Controller Unit

- Up to 32 external interrupt input pin
- Include one non-maskable interrupt(NMI)

## Watch dog Timer (2 channels)

A watchdog timer can generate interrupts or a reset when a time-out value is reached.

This series consists of two different watchdogs, a "Hardware" watchdog and a "Software" watchdog.

"Hardware" watchdog timer is clocked by low speed internal CR oscillator. Therefore, "Hardware" watchdog is active in any power saving mode except STOP mode.

## CRC (Cyclic Redundancy Check) Accelerator

The CRC accelerator helps a verify data transmission or storage integrity.

CCITT CRC16 and IEEE-802.3 CRC32 are supported.

- CCITT CRC16 Generator Polynomial: 0x1021
- IEEE-802.3 CRC32 Generator Polynomial: 0x04C11DB7

## Clock and Reset

### [Clocks]

Five clock sources (2 external oscillators, 2 internal CR oscillator, and Main PLL) that are dynamically selectable.

- Main Clock : 4 MHz to 48 MHz
- Sub Clock: 32.768 kHz
- High-speed internal CR Clock: 4 MHz
- Low-speed internal CR Clock: 100 kHz
- Main PLL Clock

### [Resets]

- Reset requests from INITX pin
- Power on reset
- Software reset
- Watchdog timers reset
- Low-voltage detector reset
- Clock supervisor reset

## Clock Super Visor (CSV)

Clocks generated by internal CR oscillators are used to supervise abnormality of the external clocks.

- External OSC clock failure (clock stop) is detected, reset is asserted.
- External OSC frequency anomaly is detected, interrupt or reset is asserted.

## Low-Voltage Detector (LVD)

This Series include 2-stage monitoring of voltage on the VCC pins. When the voltage falls below the voltage has been set, Low-Voltage Detector generates an interrupt or reset.

- LVD1: error reporting via interrupt
- LVD2: auto-reset operation

### Low Power Mode

Three power saving modes supported.

- SLEEP
- TIMER
- STOP

### Debug

- Serial Wire JTAG Debug Port (SWJ-DP)
- Embedded Trace Macrocells (ETM) provide comprehensive debug and trace facilities.

### Power Supply

Three Power Supplies

- Wide range voltage VCC  
= 2.7 V to 5.5 V
- USBVCC0  
= 3.0 V to 3.6 V: for USB ch.0 I/O voltage, when USB ch.0 is used.  
= 2.7 V to 5.5 V: when GPIO is used.
- USBVCC1  
= 3.0 V to 3.6 V: for USB ch.1 I/O voltage, when USB ch.1 is used.  
= 2.7 V to 5.5 V: when GPIO is used.

### 3. Pin Assignment

#### FPT-176P-M07

**Note:**

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

TIOA09\_0, TIOA09\_1, and TIOA09\_2 cannot be used as the external startup trigger input (TGIN signal) at I/O mode 1 (timer full mode) of the Base Timer. See "Base Timer" in "7. Handling Devices" for details.

**List of pin functions**

The number after the underscore ("\_") in pin names such as XXX\_1 and XXX\_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

**5. I/O Circuit Type**

Type	Circuit	Remarks
A	 <p>The diagram illustrates two I/O channels, X1 and X0. Channel X1 features a pull-up resistor connected to a supply rail, followed by a P-channel MOSFET. The gate of this MOSFET is controlled by a 'Pull-up resistor control' signal. The drain of the MOSFET is connected to a digital output. Channel X0 has a similar structure but includes an N-channel MOSFET connected to ground, with its gate controlled by a 'Pull-up resistor control' signal. Both channels include a resistor 'R' and a 'Feedback resistor' connected to a 'Clock input'. The circuit also includes several logic gates (AND, OR, NOT) and inverters that manage 'Standby mode control' and 'Digital input' signals.</p>	<p>It is possible to select the main oscillation / GPIO function</p> <p>When the main oscillation is selected.</p> <ul style="list-style-type: none"> <li>• Oscillation feedback resistor : Approximately 1 MΩ</li> <li>• With Standby mode control</li> </ul> <p>When the GPIO is selected.</p> <ul style="list-style-type: none"> <li>• CMOS level output.</li> <li>• CMOS level hysteresis input</li> <li>• With pull-up resistor control</li> <li>• With standby mode control</li> <li>• Pull-up resistor : Approximately 50 kΩ</li> <li>• <math>I_{OH} = -4 \text{ mA}</math>, <math>I_{OL} = 4 \text{ mA}</math></li> </ul>

Type	Circuit	Remarks
D	 <p>The diagram illustrates two digital I/O blocks, X1A and X0A, connected to a common bus through resistors labeled 'R'. Each block contains a pull-up resistor, a P-channel MOSFET (P-ch), and an N-channel MOSFET (N-ch). The P-ch MOSFETs are connected to the bus, and the N-ch MOSFETs are connected to ground. The blocks also feature various control inputs: Digital input, Standby mode control, and Clock input. A feedback resistor is connected to the bus in the X1A block. ## 6. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

### 6.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

#### Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

#### Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

#### Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

##### 1. Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

##### 2. Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

##### 3. Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

#### Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

**CAUTION:** The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
2. Be sure that abnormal current flows do not occur during the power-on sequence.

#### Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

#### Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

## Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

**CAUTION:** Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

## 6.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

### Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

### Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

### Lead-Free Packaging

**CAUTION:** When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

## Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.  
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

## Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

### Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
3. Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 M $\Omega$ ).  
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

### 6.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity  
Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
2. Discharge of Static Electricity  
When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
3. Corrosive Gases, Dust, or Oil  
Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
4. Radiation, Including Cosmic Radiation  
Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
5. Smoke, Flame  
**CAUTION:** Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

## 7. Handling Devices

### Power supply pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with each Power supply pins and GND pins of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1  $\mu\text{F}$  be connected as a bypass capacitor between each Power supply pins and GND pins, between AVCC pin and AVSS pin near this device.

### Stabilizing power supply voltage

A malfunction may occur when the power supply voltage fluctuates rapidly even though the fluctuation is within the recommended operating conditions of the VCC power supply voltage. As a rule, with voltage stabilization, suppress the voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the VCC value in the recommended operating conditions, and the transient fluctuation rate does not exceed 0.1 V/ $\mu\text{s}$  when there is a momentary fluctuation on switching the power supply.

### Crystal oscillator circuit

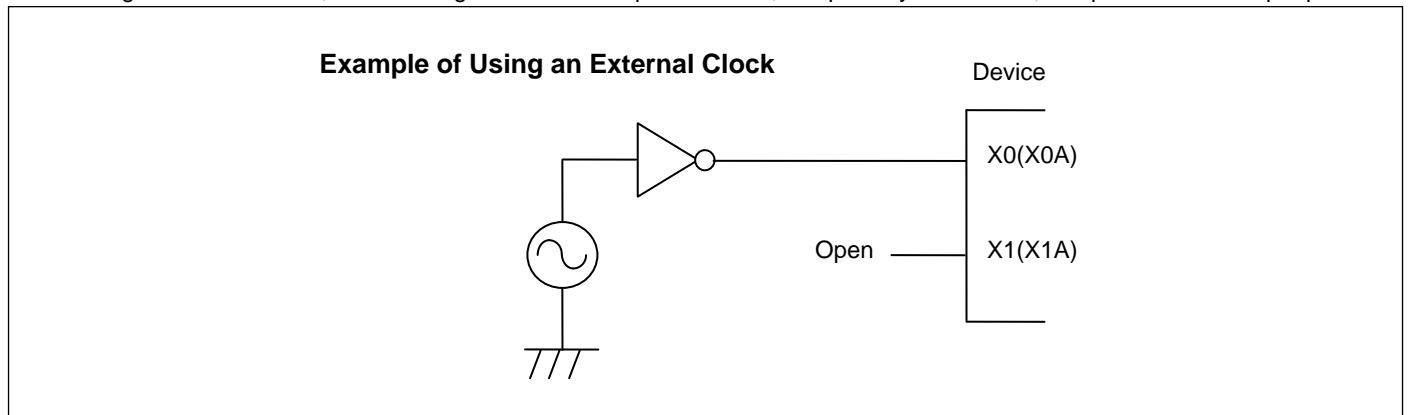

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator (or ceramic oscillator), and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane as this is expected to produce stable operation.

Evaluate oscillation of your using crystal oscillator by your mount board.

### Using an external clock

When using an external clock, the clock signal should be input to the X0,X0A pin only and the X1,X1A pin should be kept open.

### Handling when using Multi function serial pin as I<sup>2</sup>C pin

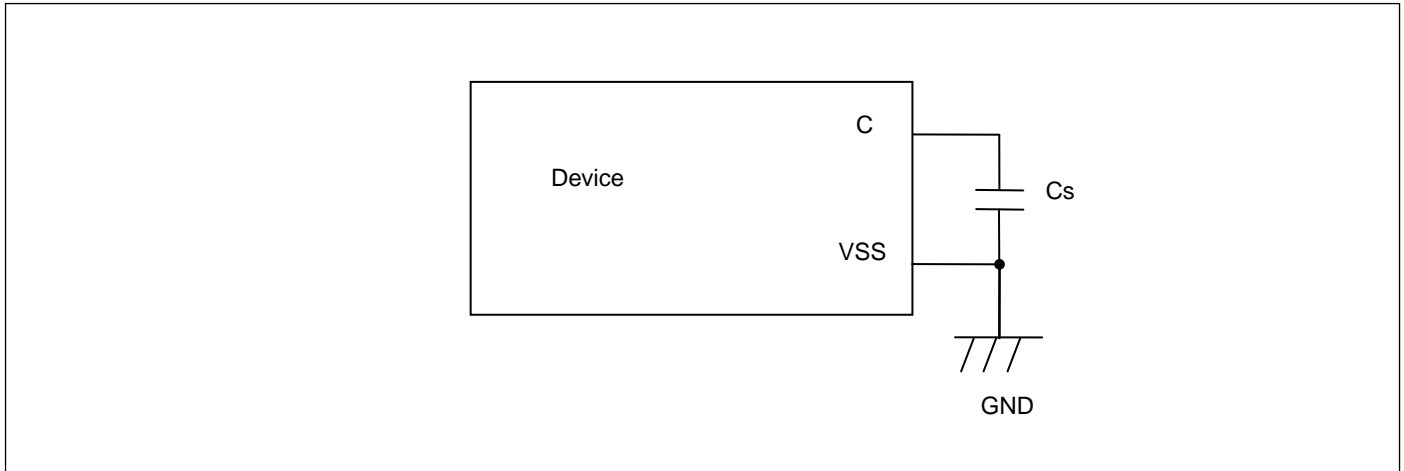

If it is using multi-function serial pin as I<sup>2</sup>C pins, P-ch transistor of digital output is always disable. However, I<sup>2</sup>C pins need to keep the electrical characteristic like other pins and not to connect to external I<sup>2</sup>C bus system with power OFF.

## C Pin

This series contains the regulator. Be sure to connect a smoothing capacitor ( $C_s$ ) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor.

However, some laminated ceramic capacitors have the characteristics of capacitance variation due to thermal fluctuation (F characteristics and Y5V characteristics). Please select the capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of a capacitor.

A smoothing capacitor of about  $4.7\mu\text{F}$  would be recommended for this series.

## Mode pins (MD0)

Connect the MD pin (MD0) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistance stays low, as well as the distance between the mode pins and VCC pins or VSS pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

## Notes on power-on

Turn power on/off in the following order or at the same time.

If not using the A/D converter, connect  $AVCC = VCC$  and  $AVSS = VSS$ .

- Turning on :     VCC → USBVCC0
- VCC → USBVCC1
- VCC → AVCC → AVRH
- Turning off :    USBVCC0 → VCC
- USBVCC1 → VCC
- AVRH → AVCC → VCC

## Serial Communication

There is a possibility to receive wrong data due to the noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider the case of receiving wrong data due to noise, perform error detection such as by applying a checksum of data at the end. If an error is detected, retransmit the data.

**Differences in features among the products with different memory sizes and between Flash products and MASK products**

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash products and MASK products are different because chip layout and memory structures are different.

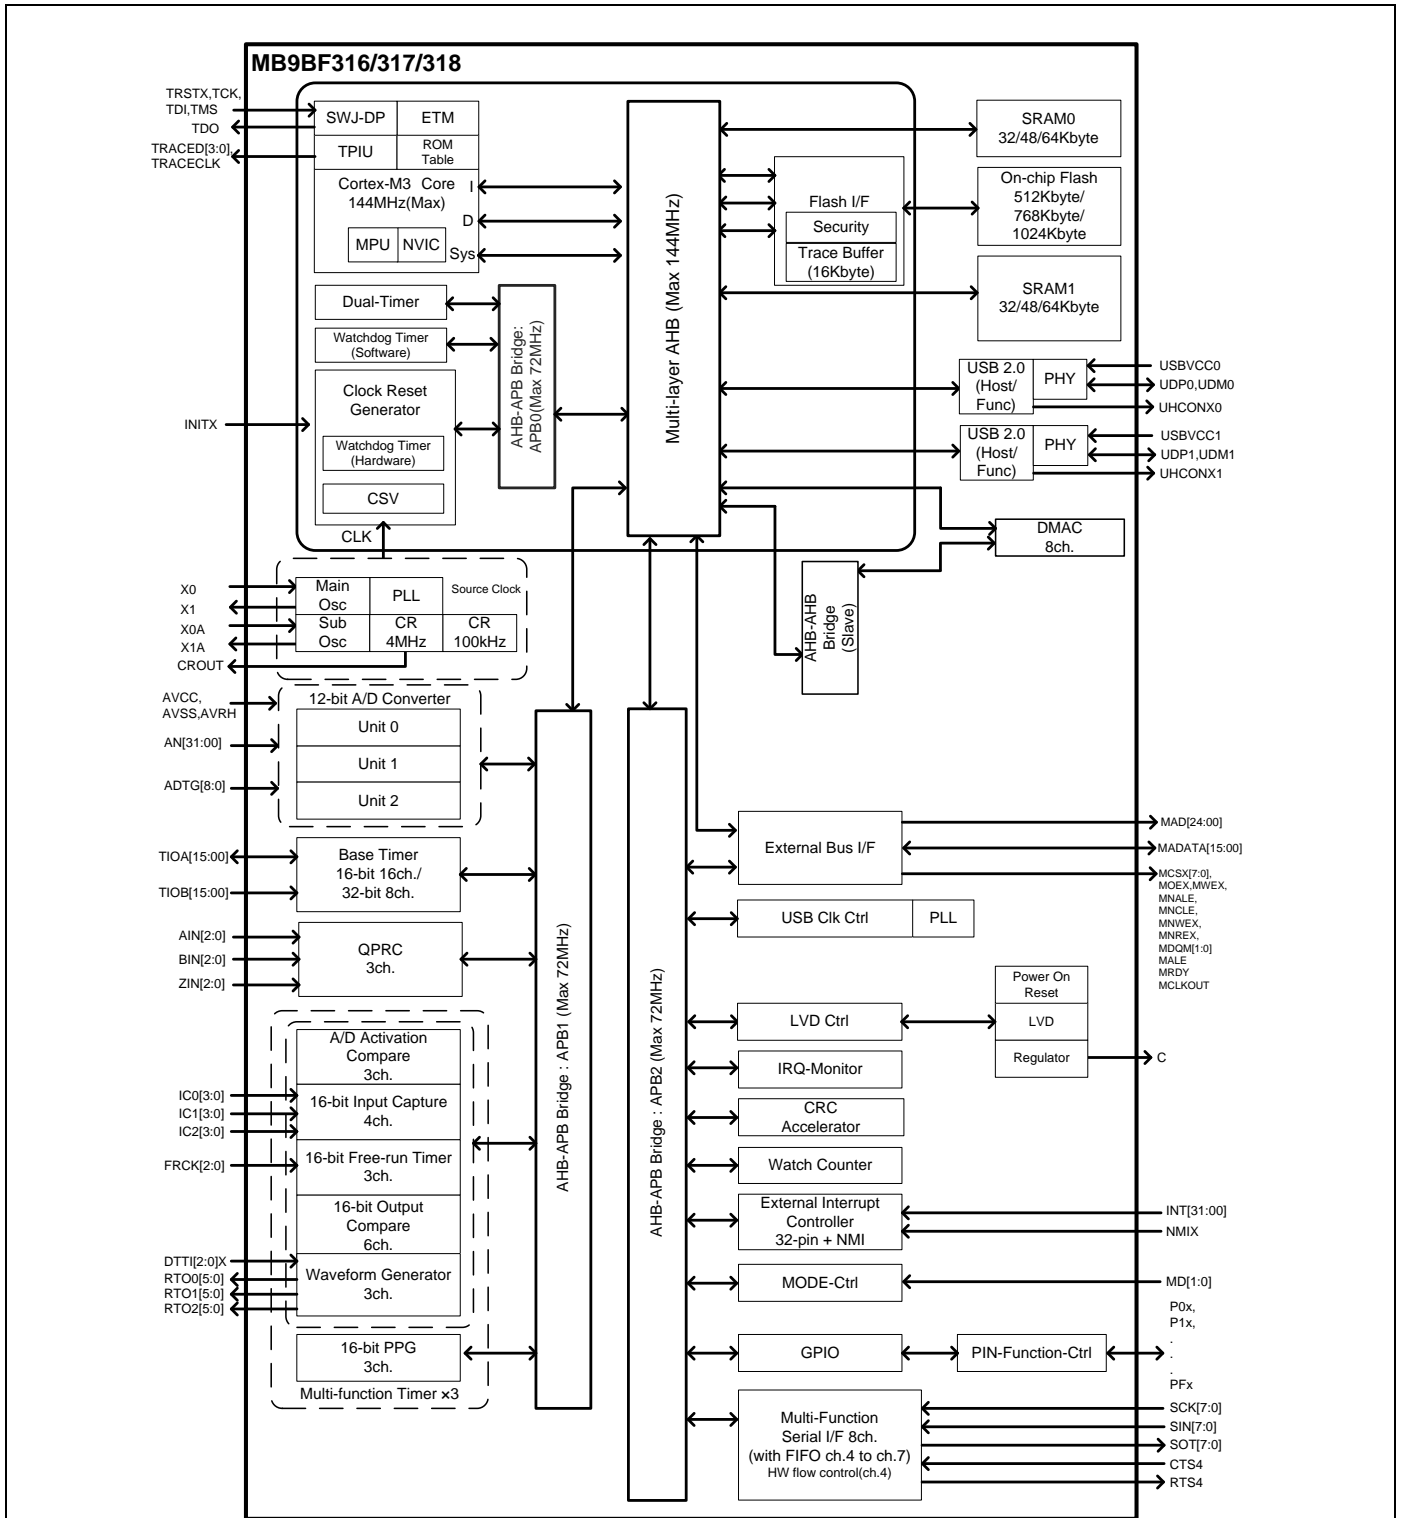

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

**Base Timer**

In the case of using ch.8 and ch.9 at I/O mode 1 (timer full mode), the TIOA09 pin cannot be used for external startup trigger input (TGIN).

Be sure to use the pin with making ESG1 and ESG2 bits of the Timer Control Register (Ch.9-TMCR) in the Base Timer to be "0b00" in order to disable trigger input.

## 11. Pin Status in Each CPU State

The terms used for pin status have the following meanings.

■ INITX=0

This is the period when the INITX pin is the "L" level.

■ INITX=1

This is the period when the INITX pin is the "H" level.

■ SPL=0

This is the status that standby pin level setting bit (SPL) in standby mode control register (STB\_CTL) is set to "0".

■ SPL=1

This is the status that standby pin level setting bit (SPL) in standby mode control register (STB\_CTL) is set to "1".

■ Input enabled

Indicates that the input function can be used.

■ Internal input fixed at "0"

This is the status that the input function cannot be used. Internal input is fixed at "L".

■ Hi-Z

Indicates that the output drive transistor is disabled and the pin is put in the Hi-Z state.

■ Setting disabled

Indicates that the setting is disabled.

■ Maintain previous state

Maintains the state that was immediately prior to entering the current mode.

If a built-in peripheral function is operating, the output follows the peripheral function.

If the pin is being used as a port, that output is maintained.

■ Analog input is enabled

Indicates that the analog input is enabled.

■ Trace output

Indicates that the trace function can be used.

\*1: These parameters are based on the condition that V<sub>SS</sub> = AV<sub>SS</sub> = 0.0 V.

\*2: V<sub>CC</sub> must not drop below V<sub>SS</sub> - 0.5 V.

\*3: USBV<sub>CC0</sub> and USBV<sub>CC1</sub> must not drop below V<sub>SS</sub> - 0.5 V.

\*4: Ensure that the voltage does not to exceed V<sub>CC</sub> + 0.5 V, for example, when the power is turned on.

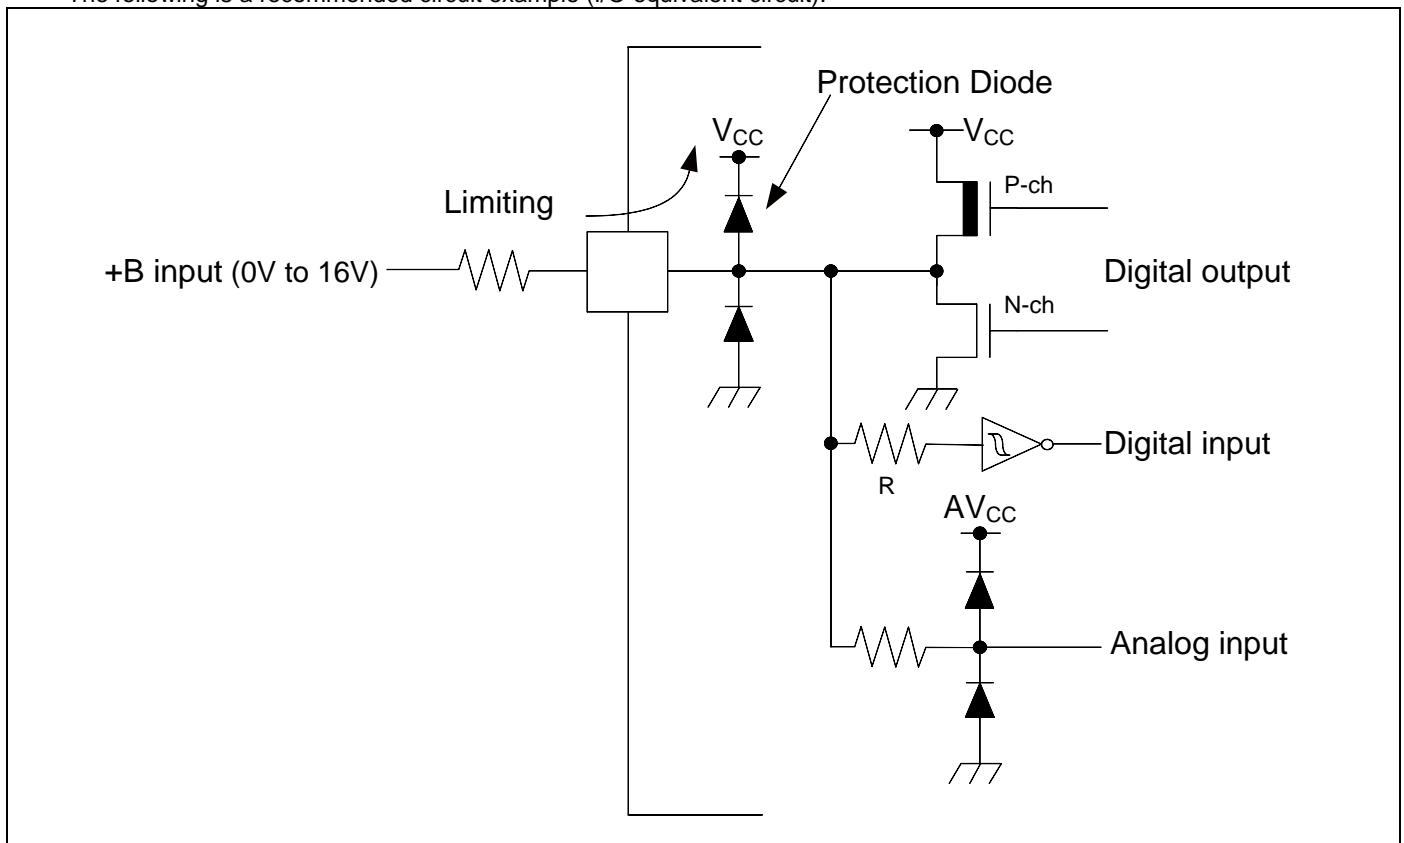

\*5: The maximum output current is the peak value for a single pin.

\*6: The average output is the average current for a single pin over a period of 100 ms.

\*7: The total average output current is the average current for all pins over a period of 100 ms.

\*8:

- See "4. List of Pin Functions" and "5. I/O Circuit Type" about +B input available pin.
- Use within recommended operating conditions.
- Use at DC voltage (current) the +B input.
- The +B signal should always be applied a limiting resistance placed between the +B signal and the device.
- The value of the limiting resistance should be set so that when the +B signal is applied the input current to the device pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the device drive current is low, such as in the low-power consumption modes, the +B input potential may pass through the protective diode and increase the potential at the VCC and AVCC pin, and this may affect other devices.
- Note that if a +B signal is input when the device power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
- The following is a recommended circuit example (I/O equivalent circuit).

**WARNING:**

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

\*3: When P83/UDP1 and P82/UDM1 pin are used as USB (UDP1, UDM1).

\*4: When P83/UDP1 and P82/UDM1 pin are used as GPIO (P83, P82).

\*5: See "C pin" in "7. Handling Devices" for the connection of the smoothing capacitor.

\*6: In between less than the minimum power supply voltage and low voltage reset/interrupt detection voltage or more, instruction execution and low voltage detection function by built-in High-speed CR (including Main PLL is used) or built-in Low-speed CR is possible to operate only.

**WARNING:**

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

		T <sub>a</sub> = - 40°C to + 85°C	3	4	5		When not trimming
Frequency stability time	t <sub>CRWT</sub>	-	-	-	90	μs	*2

\*1: In the case of using the values in CR trimming area of Flash memory at shipment for frequency trimming.

\*2: Frequency stable time is time to stable of the frequency of the High-speed CR.

Clock after the trim value is set. After setting the trim value, the period when the frequency stability Time passes can use the High-speed CR clock as a source clock.

**Low-speed Internal CR**

 (V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, T<sub>a</sub> = - 40°C to + 85°C)

Parameter	Symbol	Conditions	Value			Unit	Remarks
			Min	Typ	Max		
Clock frequency	F <sub>CRL</sub>	-	50	100	150	kHz	

### 12.4.4 Operating Conditions of Main and USB PLL (In the case of using main clock for input of PLL)

(Vcc = 2.7V to 5.5V, Vss = 0V, Ta = - 40°C to + 85°C)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max

**12.4.8 External Bus Timing**

**External bus clock output characteristics**

(V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, T<sub>a</sub> = - 40°C to + 85°C)

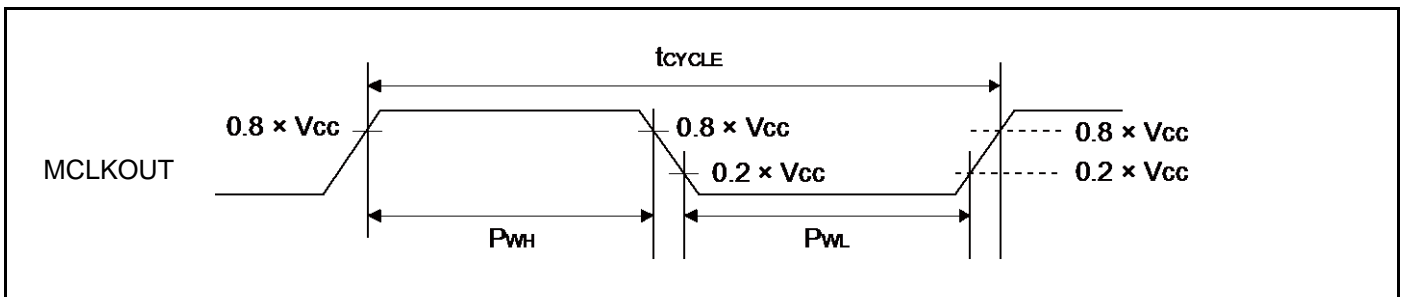

Parameter	Symbol	Pin name	Conditions	Value		Unit
				Min	Max	
Output frequency	t <sub>CYCLE</sub>	MCLKOUT*1	V <sub>CC</sub> ≥ 4.5 V	-	50*2	MHz
			V <sub>CC</sub> < 4.5 V	-	32*3	MHz

\*1: External bus clock (MCLKOUT) is divided clock of HCLK.

For more information about setting of clock divider, see "Chapter 12: External Bus Interface" in "FM3 Family Peripheral Manual".  
When external bus clock is not output, this characteristic does not give any effect on external bus operation.

\*2: When AHB bus clock frequency is more than 100MHz, the divider setting for MCLKOUT must be more than 4.

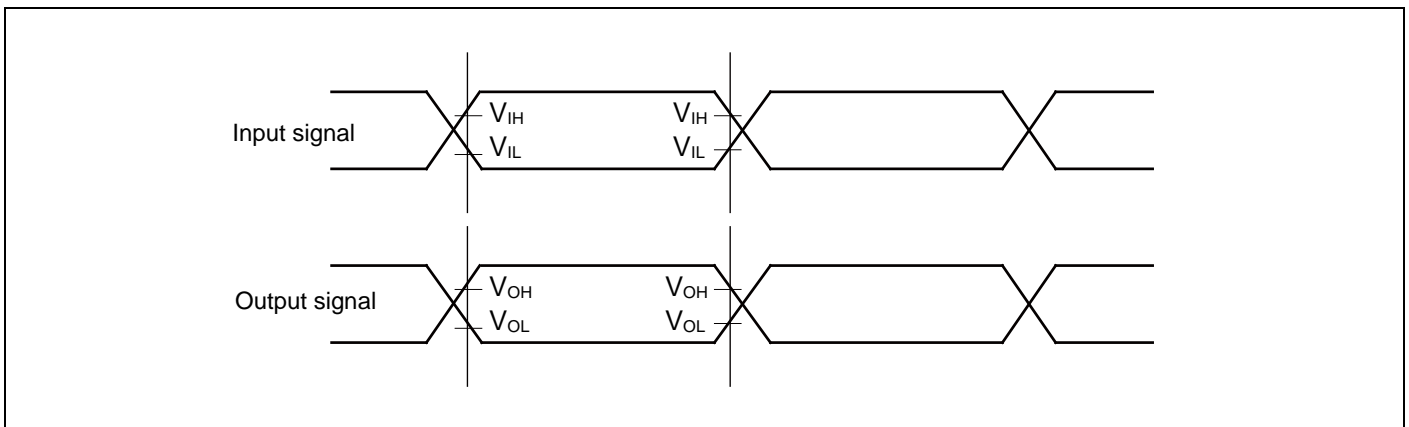

\*3: When AHB bus clock frequency is more than 64MHz, the divider setting for MCLKOUT must be more than 4.

**External bus signal input/output characteristics**

(V<sub>CC</sub> = 2.7V to 5.5V, V<sub>SS</sub> = 0V, T<sub>a</sub> = - 40°C to + 85°C)

- \*1: R and C represent the pull-up resistance and load capacitance of the SCL and SDA lines, respectively. V<sub>p</sub> indicates the power supply voltage of the pull-up resistance and I<sub>OL</sub> indicates V<sub>OL</sub> guaranteed current.
- \*2: The maximum t<sub>HDDAT</sub> must satisfy that it does not extend at least "L" period (t<sub>LOW</sub>) of device's SCL signal.
- \*3: A Fast-mode I<sup>2</sup>C bus device can be used on a Standard-mode I<sup>2</sup>C bus system as long as the device satisfies the requirement of "t<sub>SUDAT</sub> ≥ 250 ns".
- \*4: t<sub>CYCP</sub> is the APB bus clock cycle time.  
About the APB bus number which I2C is connected to, see "8. Block Diagram" in this data sheet.  
To use Standard-mode, set the APB bus clock at 2 MHz or more.  
To use Fast-mode, set the APB bus clock at 8 MHz or more.
- \*5: The number of steps of the noise filter can be changed with register settings.  
Change the number of the noise filter steps according to APB2 bus clock frequency.

\*1: The Conversion time is the value of sampling time (Ts) + compare time (Tc).

The condition of the minimum conversion time is the following.

AV<sub>cc</sub> ≥ 4.5 V, HCLK=120 MHz      sampling time: 300 ns      compare time: 700 ns

AV<sub>cc</sub> < 4.5 V, HCLK=120 MHz      sampling time: 500 ns      compare time: 700 ns

Ensure that it satisfies the value of the sampling time (Ts) and compare clock cycle (T<sub>ck</sub>).

For setting of the sampling time and compare clock cycle, see "Chapter 1-1: A/D Converter" in "FM3 Family Peripheral Manual Analog Macro Part".

The registers setting of the A/D Converter are reflected in the operation according to the APB bus clock timing.

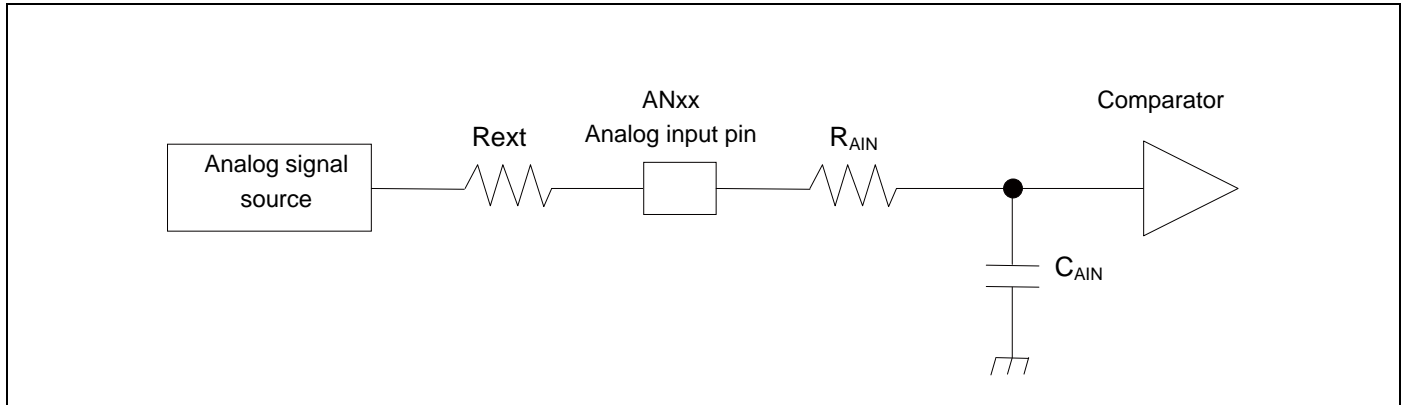

The sampling clock and compare clock is generated from the Base clock (HCLK).

About the APB bus number which the A/D Converter is connected to, see "8. Block Diagram" in this data sheet.

\*2: A necessary sampling time changes by external impedance.

Ensure that it set the sampling time to satisfy (Equation 1).

\*3: Compare time (Tc) is the value of (Equation 2).

(Equation 1)  $T_s \geq (R_{AIN} + R_{ext}) \times C_{AIN} \times 9$

T<sub>s</sub>: Sampling time

R<sub>AIN</sub>: input resistance of A/D = 2 kΩ at 4.5 ≤ AV<sub>CC</sub> ≤ 5.5  
input resistance of A/D = 3.8 kΩ at 2.7 ≤ AV<sub>CC</sub> < 4.5

C<sub>AIN</sub>: input capacity of A/D = 12.9 pF at 2.7 ≤ AV<sub>CC</sub> ≤ 5.5

R<sub>ext</sub>: Output impedance of external circuit

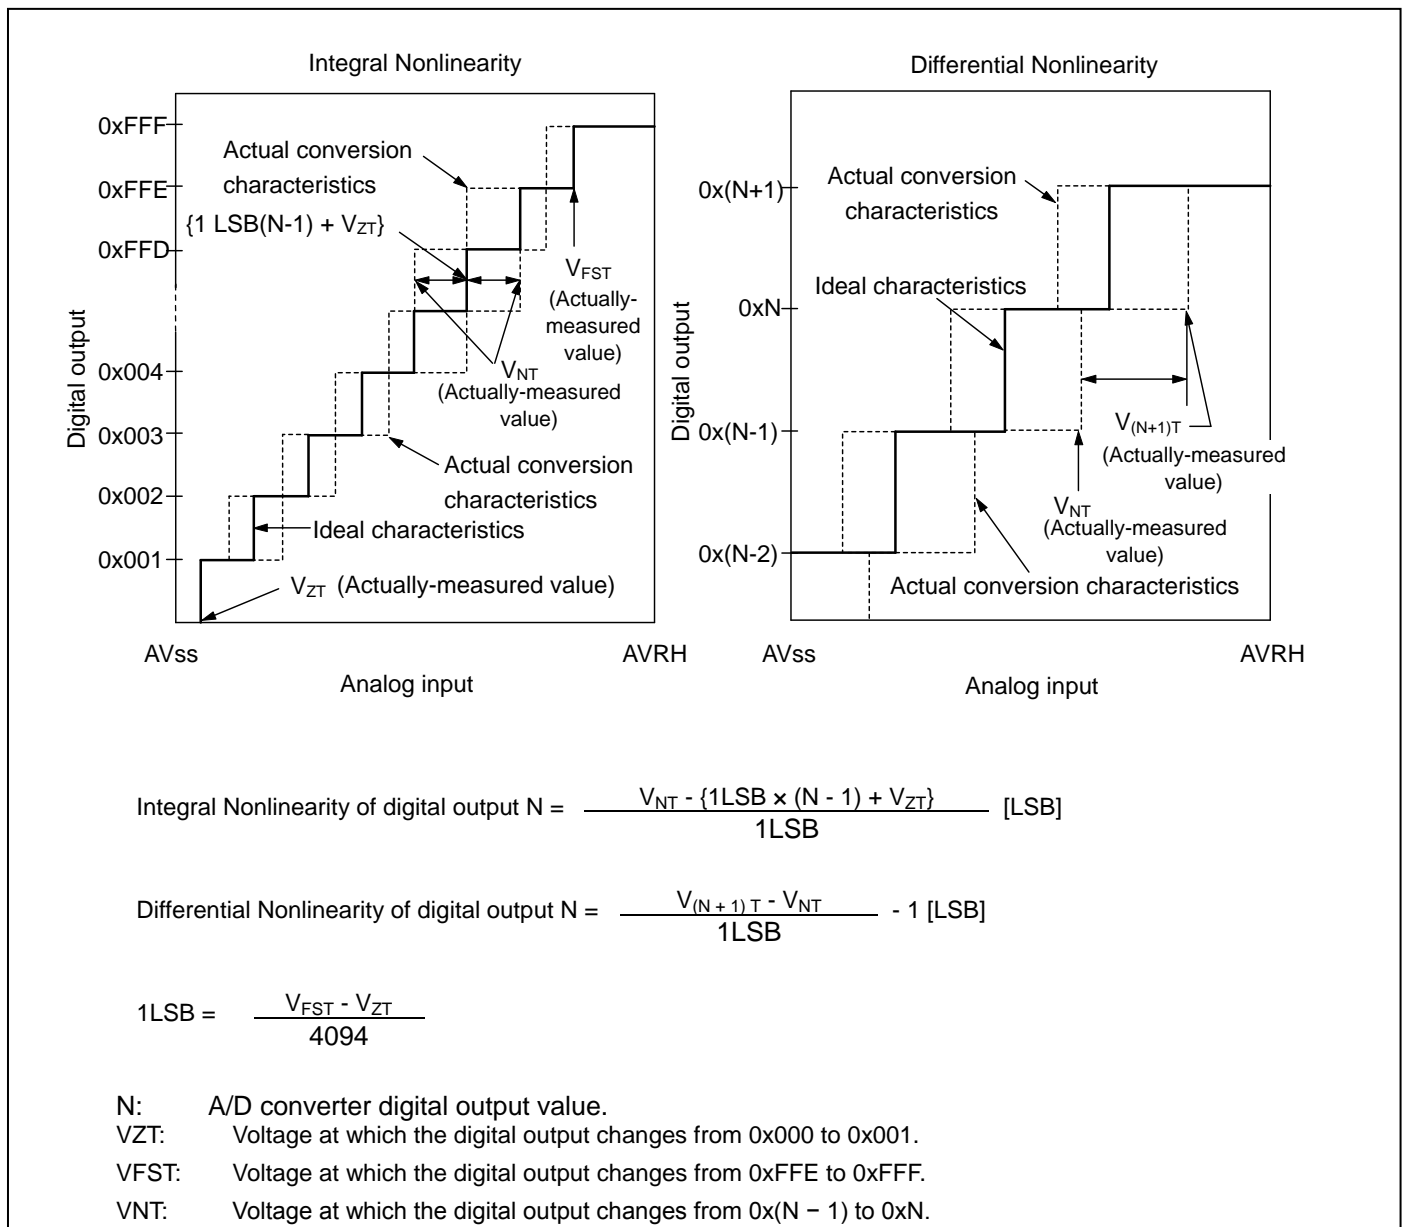

(Equation 2)  $T_c = T_{cck} \times 14$

T<sub>c</sub>: Compare time

T<sub>cck</sub>: Compare clock cycle

**Definition of 12-bit A/D Converter Terms**

- Resolution : Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity : Deviation of the line between the zero-transition point (0b000000000000 ↔ 0b000000000001) and the full-scale transition point (0b111111111110 ↔ 0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity : Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

### 12.6 USB characteristics

The USB characteristics of ch.0 and those of ch.1 are the same.  
 USBVcc0 and USBVcc1 are described as USBVcc below.

(Vcc = 2.7V to 5.5V, USBVcc = 3.0V to 3.6V, Vss = 0V, Ta = - 40°C to + 85°C)

Parameter		Symbol	Pin name	Conditions	Value		Unit	Remarks
					Min	Max		
Input characteristics	Input "H" level voltage	$V_{IH}$	UDP0, UDM0	-	2.0	USBVcc + 0.3	V	*1
	Input "L" level voltage	$V_{IL}$		-	Vss - 0.3	0.8	V	*1
	Differential input sensitivity	$V_{DI}$		-	0.2	-	V	*2
	Different common mode range	$V_{CM}$		-	0.8	2.5	V	*2
Output characteristics	Output "H" level voltage	$V_{OH}$		External pull-down resistance = 15 k $\Omega$	2.8	3.6	V	*3
	Output "L" level voltage	$V_{OL}$		External pull-up resistance = 1.5 k $\Omega$	0.0	0.3	V	*3
	Crossover voltage	$V_{CRS}$		-	1.3	2.0	V	*4
	Rise time	$t_{FR}$		Full-Speed	4	20	ns	*5
	Fall time	$t_{FF}$		Full-Speed	4	20	ns	*5
	Rise/ fall time matching	$t_{FRFM}$		Full-Speed	90	111.11	%	*5
	Output impedance	$Z_{DRV}$	Full-Speed	28	44	$\Omega$	*6	
	Rise time	$t_{LR}$	Low-Speed	75	300	ns	*7	
	Fall time	$t_{LF}$	Low-Speed	75	300	ns	*7	
	Rise/ fall time matching	$t_{LRFM}$	Low-Speed	80	125	%	*7	

\*1: The switching threshold voltage of Single-End-Receiver of USB I/O buffer is set as within  $V_{IL}$  (Max) = 0.8 V,  $V_{IH}$  (Min) = 2.0 V (TTL input standard).

There are some hysteresis to lower noise sensitivity.

\*2: Use differential-Receiver to receive USB differential data signal.

Differential-Receiver has 200 mV of differential input sensitivity when the differential data input is within 0.8 V to 2.5 V to the local ground reference level.

Above voltage range is the common mode input voltage.

- \*3: The output drive capability of the driver is below 0.3 V at Low-State ( $V_{OL}$ ) (to 3.6 V and 1.5 k $\Omega$  load), and 2.8 V or above (to ground and 1.5 k $\Omega$  load) at High-State ( $V_{OH}$ ).
- \*4: The cross voltage of the external differential output signal (D + /D - ) of USB I/O buffer is within 1.3 V to 2.0 V.

- \*5: They indicate rise time ( $T_{rise}$ ) and fall time ( $T_{fall}$ ) of the full-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage. For full-speed buffer,  $T_r/T_f$  ratio is regulated as within  $\pm 10\%$  to minimize RFI emission.

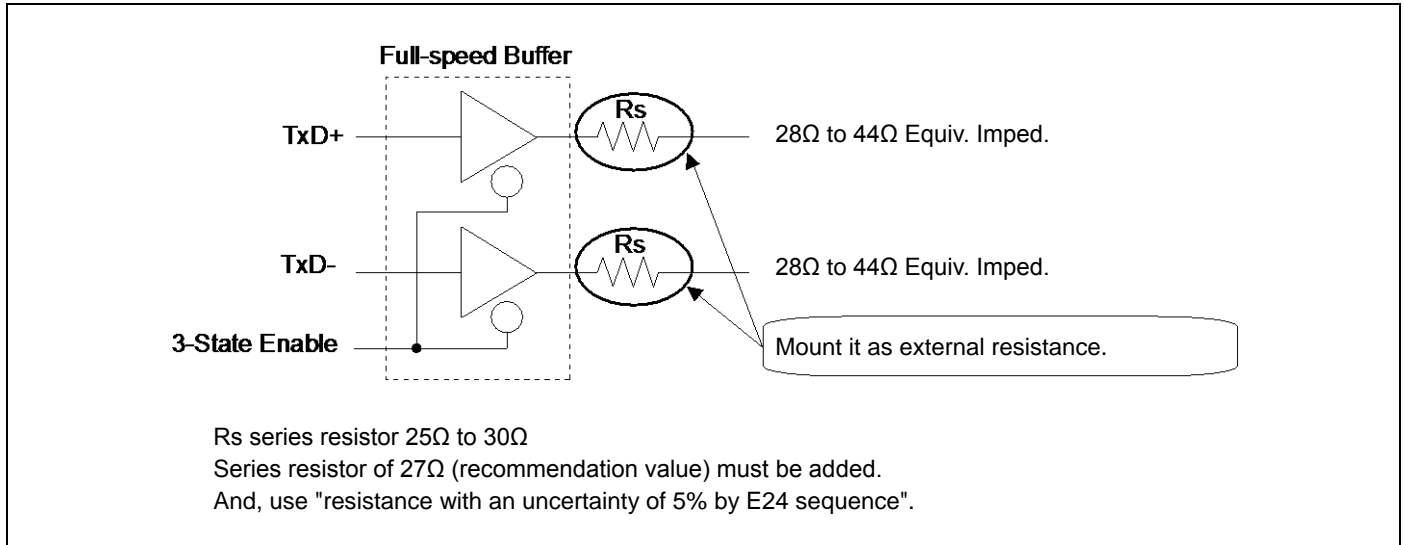

\*6: USB Full-speed connection is performed via twist pair cable shield with  $90 \Omega \pm 15\%$  characteristic impedance (Differential Mode).

USB standard defines that output impedance of USB driver must be in range from  $28 \Omega$  to  $44 \Omega$ . So, discrete series resistor ( $R_s$ ) addition is defined in order to satisfy the above definition and keep balance.

When using this USB I/O, use it with  $25 \Omega$  to  $30 \Omega$  (recommendation value  $27 \Omega$ ) series resistor  $R_s$ .

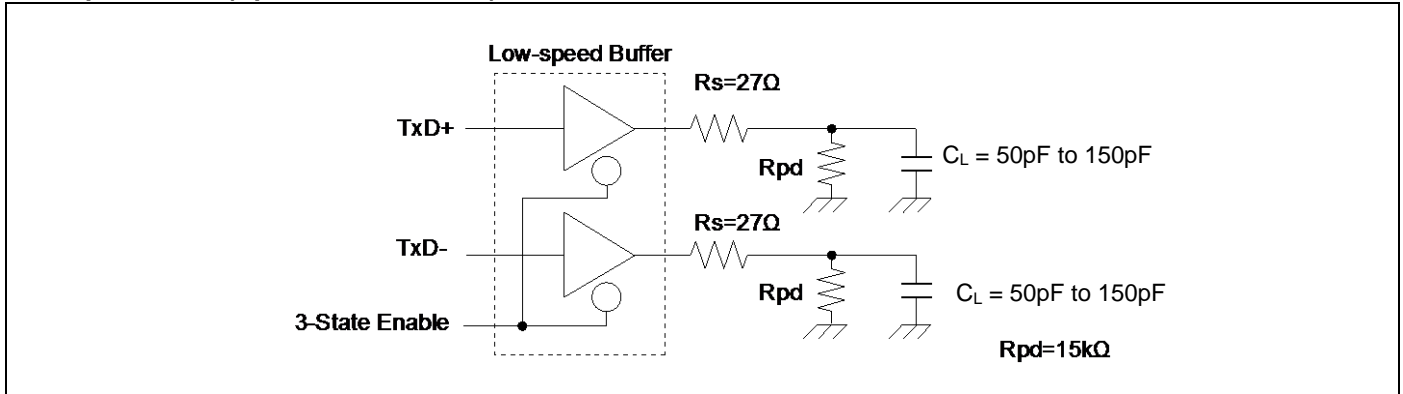

\*7: They indicate rise time ( $T_{rise}$ ) and fall time ( $T_{fall}$ ) of the low-speed differential data signal.

They are defined by the time between 10% and 90% of the output signal voltage.

Erase/write cycles (cycle)	Data hold time (year)	Remarks
1,000	20*	
10,000	10*	
100,000	5*	

\*: At average + 85°C

**12.9 Return Time from Low-Power Consumption Mode**

**12.9.1 Return Factor: Interrupt**

The return time from Low-Power consumption mode is indicated as follows. It is from receiving the return factor to starting the program operation.

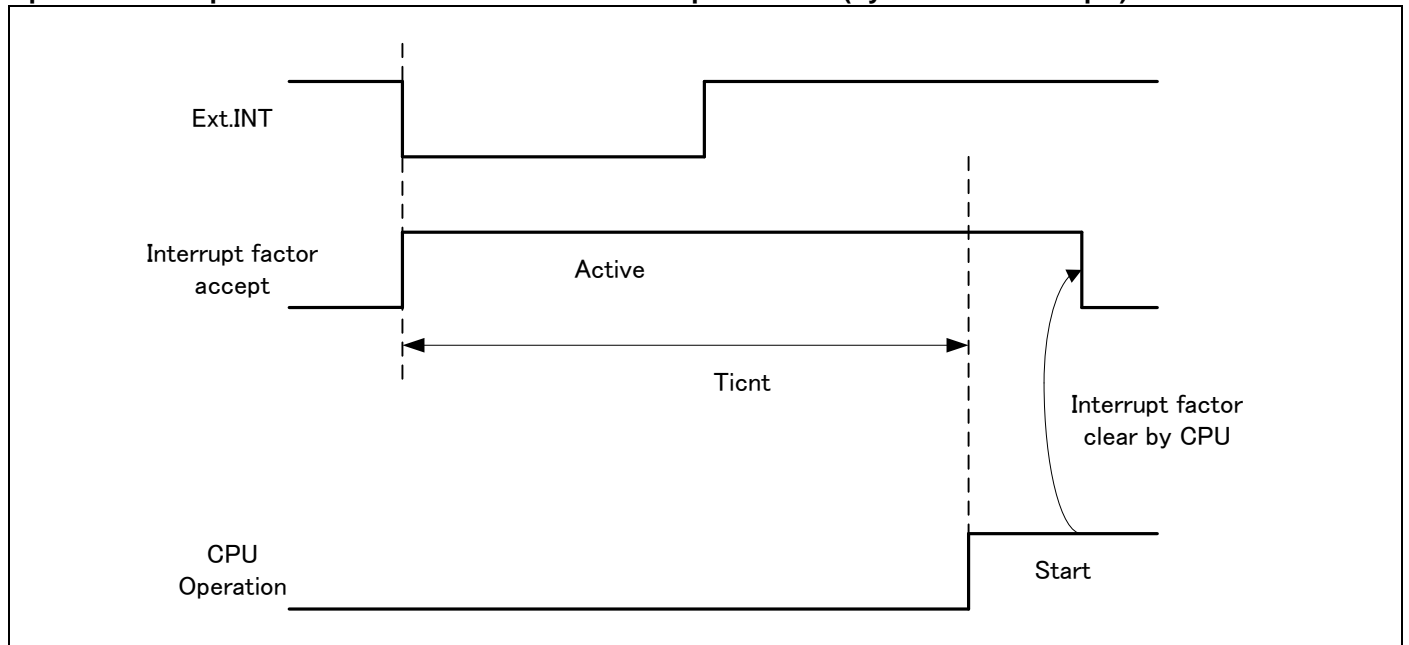

**Return Count Time**

( $V_{CC} = 2.7V$  to  $5.5V$ ,  $T_a = -40^{\circ}C$  to  $+85^{\circ}C$ )

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max*		
SLEEP mode	Ticnt	$t_{CYCC}$		ns	
High-speed CR TIMER mode, Main TIMER mode, PLL TIMER mode		40	80	$\mu s$	
Low-speed CR TIMER mode		453	737	$\mu s$	
Sub TIMER mode		453	737	$\mu s$	
STOP mode		453	737	$\mu s$	

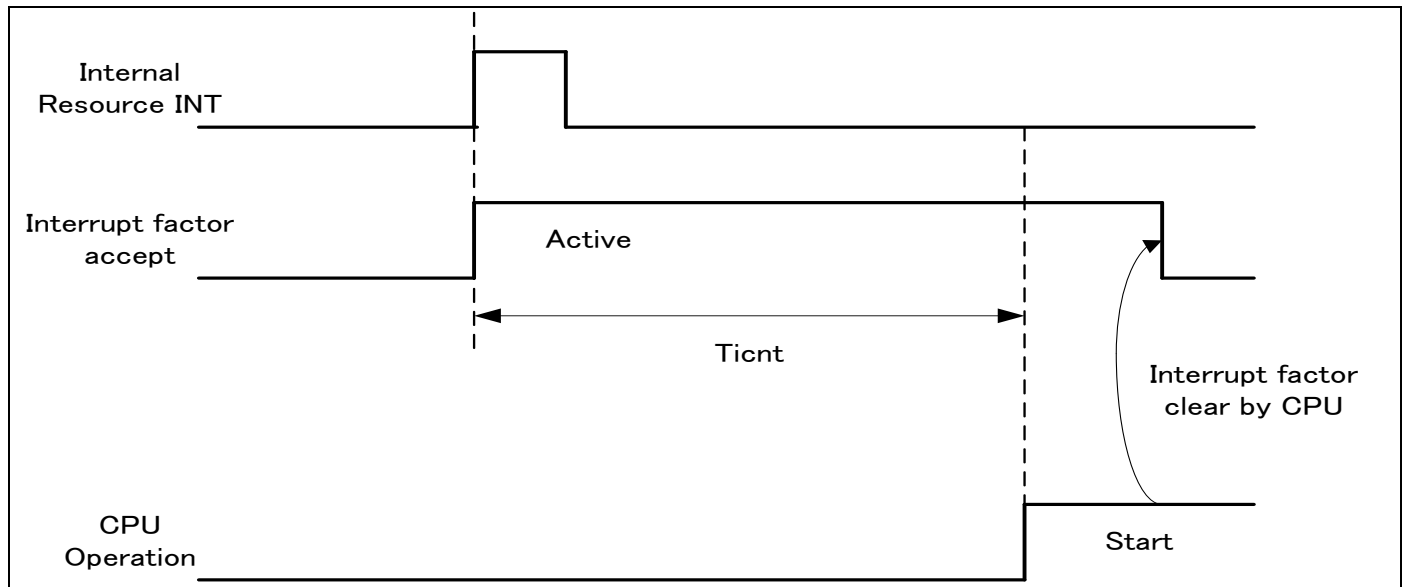

\*: The maximum value depends on the accuracy of built-in CR.

**Operation example of return from Low-Power consumption mode (by external interrupt\*)**

\*: External interrupt is set to detecting fall edge.

**Operation example of return from Low-Power consumption mode (by internal resource interrupt\*)**

\* : Internal resource interrupt is not included in return factor by the kind of Low-Power consumption mode.

**Notes:**

- The return factor is different in each Low-Power consumption modes.  
See "Chapter 6: Low Power Consumption Mode" and "Operations of Standby Modes" in FM3 Family Peripheral Manual about the return factor from Low-Power consumption mode.
- When interrupt recovers, the operation mode that CPU recovers depends on the state before the Low-Power consumption mode transition. See "Chapter 6: Low Power Consumption Mode" in "FM3 Family Peripheral Manual".

## 12.9.2 Return Factor: Reset

The return time from Low-Power consumption mode is indicated as follows. It is from releasing reset to starting the program operation.

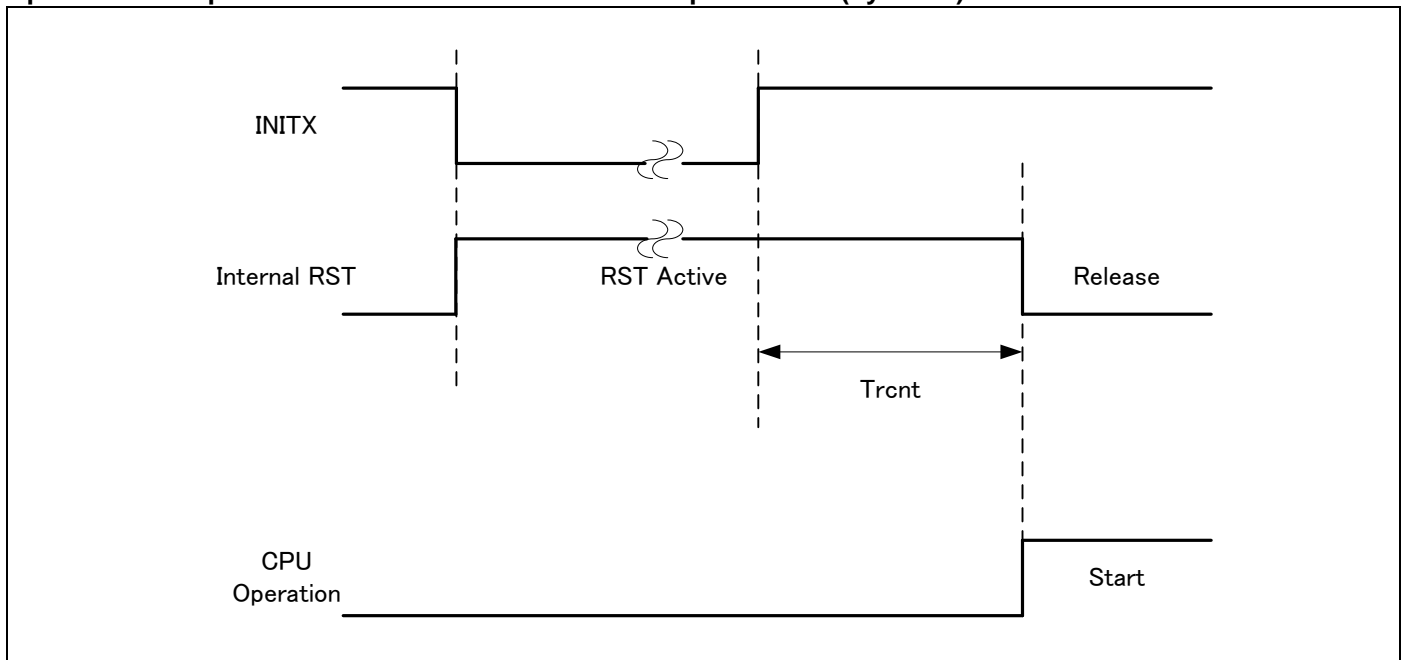

### Return Count Time

( $V_{CC} = 2.7V$  to  $5.5V$ ,  $T_a = -40^{\circ}C$  to  $+85^{\circ}C$ )

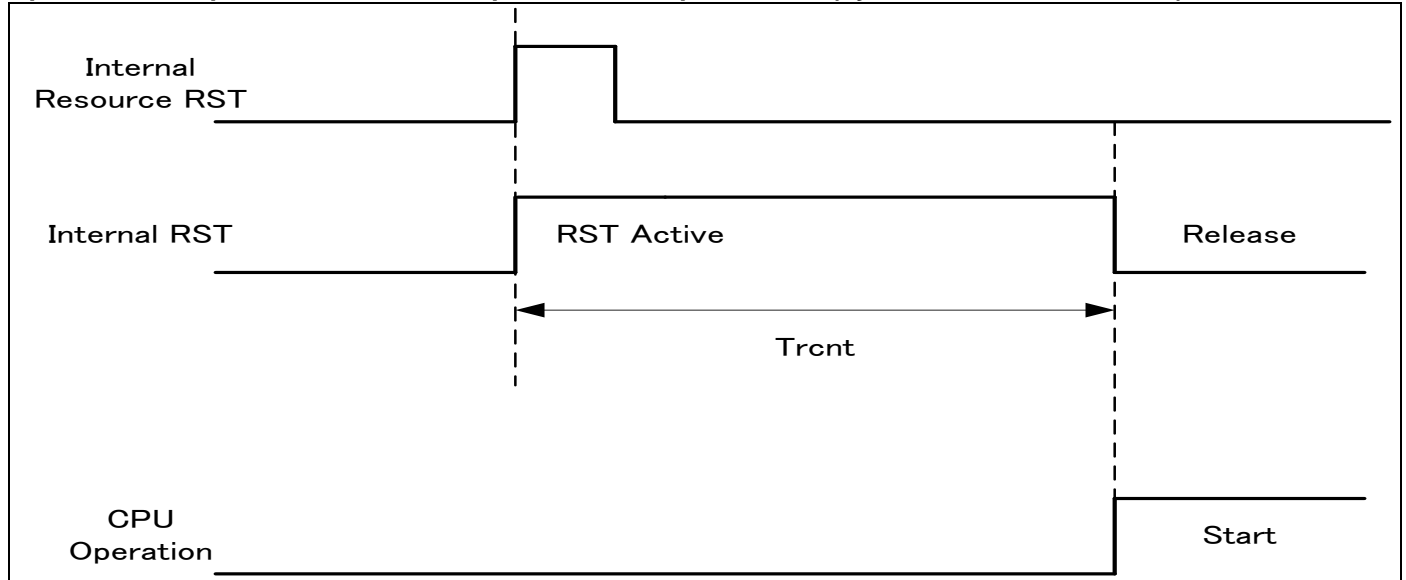

Parameter	Symbol	Value		Unit	Remarks
		Typ	Max*		
SLEEP mode	Trcnt	321	461	$\mu s$	
High-speed CR TIMER mode, Main TIMER mode, PLL TIMER mode		321	461	$\mu s$	
Low-speed CR TIMER mode		441	701	$\mu s$	
Sub TIMER mode		441	701	$\mu s$	
STOP mode		441	701	$\mu s$	

\*: The maximum value depends on the accuracy of built-in CR.

### Operation example of return from Low-Power consumption mode (by INITX)

**Operation example of return from low power consumption mode (by internal resource reset\*)**

\*: Internal resource reset is not included in return factor by the kind of Low-Power consumption mode.

**Notes:**

- The return factor is different in each Low-Power consumption modes.  
See "Chapter 6: Low Power Consumption Mode" and "Operations of Standby Modes" in FM3 Family Peripheral Manual.
- When interrupt recovers, the operation mode that CPU recovers depends on the state before the Low-Power consumption mode transition. See "Chapter 6: Low Power Consumption Mode" in "FM3 Family Peripheral Manual".
- The time during the power-on reset/low-voltage detection reset is excluded. See "12.4.7. Power-on Reset Timing in 12.4. AC Characteristics in Electrical Characteristics" for the detail on the time during the power-on reset/low -voltage detection reset.
- When in recovery from reset, CPU changes to the high-speed CR run mode. When using the main clock or the PLL clock, it is necessary to add the main clock oscillation stabilization wait time or the main PLL clock stabilization wait time.
- The internal resource reset means the watchdog reset and the CSV reset.

Any information provided in this document, including any sample design information or programming code, is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Cypress products are not designed, intended, or authorized for use as critical components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or system could cause personal injury, death, or property damage ("Unintended Uses"). A critical component is any component of a device or system whose failure to perform can be reasonably expected to cause the failure of the device or system, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and Company shall and hereby does release Cypress from any claim, damage, or other liability arising from or related to all Unintended Uses of Cypress products. Company shall indemnify and hold Cypress harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of Cypress products.
