

S6E2C5 Series

32-bit ARM[®] Cortex[®]-M4F FM4 Microcontroller

Devices in the S6E2C5 Series are highly integrated 32-bit microcontrollers with high performance and competitive cost. This series is based on the ARM Cortex-M4F processor with on-chip flash memory and SRAM. The series has peripherals such as motor control timers, A/D converters, and communications interfaces (USB, CAN, UART, CSIO (SPI), I²C, LIN). The products that are described in this data sheet are placed into TYPE3-M4 product categories "FM4 Family Peripheral Manual Main Part (002-04856)."

Features

32-bit ARM Cortex-M4F Core

- Processor version: r0p1
- Up to 200 MHz frequency operation
- FPU built-in
- Support DSP instructions
- Memory protection unit (MPU): improves the reliability of an embedded system
- Integrated nested vectored interrupt controller (NVIC): 1 NMI (non-maskable interrupt) and 128 peripheral interrupts and 16 priority levels
- 24-bit system timer (Sys Tick): system timer for OS task management

On-chip Memories

- Flash memory
This series is based on two independent on-chip flash memories.
 - Up to 2048 Kbytes
 - Built-in flash accelerator system with 16 Kbytes trace buffer memory
 - Read access to flash memory that can be achieved without wait-cycle up to an operating frequency of 72 MHz. Even at the operating frequency more than 72 MHz, an equivalent single cycle access to flash memory can be obtained by the flash accelerator system.
 - Security function for code protection
- SRAM
This is composed of three independent SRAMs (SRAM0, SRAM1 and SRAM2). SRAM0 is connected to the I-code bus or D-code bus of Cortex-M4F core. SRAM1 and SRAM2 are connected to system bus of Cortex-M4F core.
 - SRAM0: up to 192 Kbytes
 - SRAM1: 32 Kbytes
 - SRAM2: 32 Kbytes

External Bus Interface

- Supports SRAM, NOR, NAND flash and SDRAM device
- Up to 9 chip selects CS0 to CS8 (CS8 is only for SDRAM)
- 8-/16-/32-bit data width
- Up to 25-bit address bus
- Supports address/data multiplexing
- Supports external RDY function
- Supports scramble function
- Possible to set the validity/invalidity of the scramble function for the external areas 0x6000_0000 to 0xDFFF_FFFF in 4 Mbytes units.
- Possible to set two kinds of the scramble key
Note: It is necessary to use the Cypress provided software library to use the scramble function.

USB Interface (Max two Channels)

The USB interface is composed of a function and a host.

- USB function
 - USB 2.0 Full-speed supported
 - Max 6 EndPoint supported
 - EndPoint 0 is control transfer
 - EndPoint 1, 2 can be selected bulk-transfer, interrupt-transfer or isochronous-transfer
 - EndPoint 3 to 5 can select bulk-transfer or interrupt-transfer
 - EndPoint 1 to 5 comprise double buffer
 - The size of each endpoint is as follows.
 - Endpoint 0, 2 to 5: 64 byte
 - Endpoint 1: 256 byte
- USB host
 - USB2.0 Full-Speed/Low-Speed supported
 - Bulk-transfer, interrupt-transfer, and isochronous-transfer support
 - USB Device connected/dis-connected automatically detect
 - IN/OUT token handshake packet automatically
 - Max 256-byte packet length supported
 - Wake-up function supported

CAN Interface (Max two Channels)

- Compatible with CAN specification 2.0A/B
- Maximum transfer rate: 1 Mbps
- Built-in 32-message buffer

CAN-FD Interface (One Channel)

- Compatible with CAN Specification 2.0A/B
- Maximum transfer rate: 5 Mbps
- Message buffer for receiver: up to 192 messages
- Message buffer for transmitter: up to 32 messages
- CAN with flexible data rate (non-ISO CAN FD)
- Notes:
 - CAN FD cannot communicate between non-ISO CAN FD and ISO CAN FD, because non-ISO CAN FD and ISO CAN FD are different frame format.
 - About the problem of "non-ISO CAN FD", see the White Paper from CiA(CAN in Automation).
http://www.can-newsletter.org/engineering/standardization/141222_can-fd-and-crc-issued_white-paper_bosch

Multi-function Serial Interface (Max 16 channels)

- Separate 64 byte receive and transmit FIFO buffers for channels 0 to 7.
- Operation mode is selectable for each channel from the following:
 - UART
 - CSIO (SPI)
 - LIN
 - I²C
- UART
 - Full-duplex double buffer
 - Selection with or without parity supported
 - Built-in dedicated baud rate generator
 - External clock available as a serial clock
 - Various error detect functions available (parity errors, framing errors, and overrun errors)
- CSIO (SPI)
 - Full-duplex double buffer
 - Built-in dedicated baud rate generator
 - Overrun error detect function available
 - Serial chip select function (ch 6 and ch 7 only)
 - Supports high-speed SPI (ch 4 and ch 6 only)
 - Data length 5 to 16-bit
- LIN
 - LIN protocol Rev.2.1 supported
 - Full-duplex double buffer
 - Master/slave mode supported
 - LIN break field generation (can change to 13- to 16-bit length)
 - LIN break delimiter generation (can change to 1- to 4-bit length)
 - Various error detect functions available (parity errors, framing errors, and overrun errors)

I²C

- Standard mode (Max 100 kbps)/Fast mode (Max 400 kbps) supported
- Fast mode Plus (Fm+) (Max 1000 kbps, only for ch 3 = ch A and ch 7 = ch B) supported

DMA Controller (Eight channels)

DMA controller has an independent bus, so the CPU and DMA controller can process simultaneously.

- Eight independently configured and operated channels
- Transfer can be started by software or request from the built-in peripherals
- Transfer address area: 32-bit (4 GB)
- Transfer mode: Block transfer/Burst transfer/Demand transfer
- Transfer data type: bytes/half-word/word
- Transfer block count: 1 to 16
- Number of transfers: 1 to 65536

DSTC (Descriptor System data Transfer Controller; 256 Channels)

The DSTC can transfer data at high-speed without going via the CPU. The DSTC adopts the descriptor system and, following the specified contents of the descriptor that has already been constructed on the memory, can access directly the memory/peripheral device and perform the data-transfer operation.

It supports the software activation, the hardware activation, and the chain activation functions.

A/D Converter (Max 32 channels)

- 12-bit A/D Converter
 - Successive approximation type
 - Built-in three units
 - Conversion time: 0.5 μs at 5 V
 - Priority conversion available (priority at two levels)
 - Scanning conversion mode
 - Built-in FIFO for conversion data storage (for SCAN conversion: 16 steps, for priority conversion: 4 steps)

D/A Converter (Max 2 Channels)

- R-2R type
- 12-bit resolution

Base Timer (Max 16 Channels)

Operation mode is selected from the following for each channel:

- 16-bit PWM timer
- 16-bit PPG timer
- 16-/32-bit reload timer
- 16-/32-bit PWC timer

General Purpose I/O Port

This series can use its pins as general purpose I/O ports when they are not used for external bus or peripherals; moreover, the port relocate function is built in. It can set the I/O port to which the peripheral function can be allocated.

- Capable of pull-up control per pin
- Capable of reading pin level directly
- Built-in port-relocate function
- Up to 120 high-speed general-purpose I/O ports in 144 pin package
- Some pins 5V tolerant I/O.
See 4. Pin Descriptions and 5. I/O Circuit Type for the corresponding pins.

Multi-function Timer (Max three Units)

The multi-function timer is composed of the following blocks:

Minimum resolution: 5.00 ns

- 16-bit free-run timer × 3 ch/unit
- Input capture × 4 ch/unit
- Output compare × 6 ch/unit
- A/D activation compare × 6 ch/unit
- Waveform generator × 3 ch/unit
- 16-bit PPG timer × 3 ch/unit

The following functions can be used to achieve the motor control:

- PWM signal output function
- DC chopper waveform output function
- Dead time function
- Input capture function
- A/D convertor activate function
- DTIF (motor emergency stop) interrupt function

Real-Time Clock (RTC)

The real-time clock can count year, month, day, hour, minute, second, or day of the week from 00 to 99.

- Interrupt function with specifying date and time (year/month/day/hour/minute/second/day of the week) is available. This function is also available by specifying only year, month, day, hour, or minute.
- Timer interrupt function after set time or each set time.
- Capable of rewriting the time with continuing the time count.
- Leap year automatic count is available.

Quadrature Position/Revolution Counter (QPRC; Max four Channels)

The Quadrature Position/Revolution Counter (QPRC) is used to measure the position of the position encoder. It is also possible to use up/down counter.

- The detection edge of the three external event input pins AIN, BIN and ZIN is configurable.
- 16-bit position counter
- 16-bit revolution counter
- Two 16-bit compare registers

Dual Timer (32-/16-bit Down Counter)

The dual timer consists of two programmable 32-/16-bit down counters.

Operation mode is selectable from the following for each channel:

- Free-running
- Periodic (= Reload)
- One shot

Watch Counter

The watch counter is used for wake up from low-power consumption mode. It is possible to select the main clock, sub clock, built-in High-speed CR clock, or built-in low-speed CR clock as the clock source.

- Interval timer: up to 64 s (max) with a sub clock of 32.768 kHz

External Interrupt Controller Unit

- External interrupt input pin: Max 32 pins
- Include one non-maskable interrupt (NMI)

Watchdog Timer (2 Channels)

A watchdog timer can generate interrupts or a reset when a time-out value is reached.

This series consists of two different watchdogs: a "hardware" watchdog and a "software" watchdog.

The hardware watchdog timer is clocked by low-speed internal CR oscillator. The hardware watchdog is thus active in any power saving mode except RTC mode and Stop mode.

Cyclic Redundancy Check (CRC) Accelerator

The CRC accelerator helps to verify data transmission or storage integrity.

CCITT CRC16 and IEEE-802.3 CRC32 are supported.

- CCITT CRC16 generator polynomial: 0x1021
- IEEE-802.3 CRC32 generator polynomial: 0x04C11DB7

Programmable Cyclic Redundancy Check (PRGCRC) Accelerator

The CRC accelerator helps a verify data transmission or storage integrity.

CCITT CRC16, IEEE-802.3 CRC32 and generating polynomial are supported.

- CCITT CRC16 generator polynomial: 0x1021
- IEEE-802.3 CRC32 generator polynomial: 0x04C11DB7
- Generating polynomial

SD Card Interface

It is possible to use the SD card that conforms to the following standards.

- Part 1 Physical Layer Specification version 3.01
- Part E1 SDIO Specification version 3.00
- Part A2 SD Host Controller Standard Specification version 3.00
- 1-bit or 4-bit data bus

I²S (Inter-IC Sound Bus) Interface (TX x 1 channel, RX x 1 channel)

- Supports three transfer protocols
 - I²S
 - Left justified
 - DSP mode
 - Separate clock generation block for flexible system integration options
- Master/slave mode selectable
- RX Only, TX Only or TX and RX simultaneous operation selectable
- Word length is programmable from 7-bits to 32 bits
- RX/TX FIFO integrated (RX: 66 words x 32-bits, TX: 66 words x 32-bits)
- DMA, interrupts, or polling based data transfer supported

Clock and Reset

- Clocks

Five clock sources (two external oscillators, two internal CR oscillators, and Main PLL) that are dynamically selectable.

 - Main clock: 4 MHz to 48 MHz
 - Sub clock: 32.768 kHz
 - High-speed internal CR clock: 4 MHz
 - Low-speed internal CR clock: 100 kHz
 - Main PLL Clock
- Resets
 - Reset requests from INITX pin
 - Power on reset
 - Software reset
 - Watchdog timer reset
 - Low-voltage detector reset
 - Clock supervisor reset

Clock Supervisor (CSV)

Clocks generated by internal CR oscillators are used to supervise abnormality of the external clocks.

- External OSC clock failure (clock stop) is detected, reset is asserted.
- External OSC frequency anomaly is detected, interrupt or reset is asserted.

Low-Voltage Detector (LVD)

This Series include two-stage monitoring of voltage on the VCC pins. when the voltage falls below the voltage that has been set, the low-voltage detector function generates an interrupt or reset.

- LVD1: error reporting via interrupt
- LVD2: auto-reset operation

Low-power Consumption Mode

Six low power consumption modes are supported.

- Sleep
- Timer
- RTC
- Stop
- Deep standby RTC (selectable from with/without RAM retention)
- Deep standby stop (selectable from with/without RAM retention)

Peripheral Clock Gating

The system can reduce the current consumption of the total system with gating the operation clocks of peripheral functions not used.

VBAT

The consumption power during the RTC operation can be reduced by supplying the power supply independent from the RTC (calendar circuit)/32 kHz oscillation circuit. The following circuits can also be used.

- RTC
- 32-kHz oscillation circuit
- Power-on circuit
- Back up register: 32 bytes
- Port circuit

Debug

- Serial wire JTAG debug port (SWJ-DP)
- Embedded trace macrocells (ETM) provide comprehensive debug and trace facilities.
- AHB trace macrocells (HTM)

Unique ID

Unique value of the device (41-bit) is set.

Power Supply

- Five power supplies
 - Wide range voltage:
VCC = 2.7 V to 5.5 V
 - Power supply for USB ch 0 I/O:
USBVCC0 = 3.0 V to 3.6 V (when USB is used)
= 2.7 V to 5.5 V (when GPIO is used)
 - Power supply for USB ch 1 I/O:
USBVCC1 = 3.0 V to 3.6 V (when USB is used)
= 2.7 V to 5.5 V (when GPIO is used)
 - Power supply for VBAT:
VBAT = 1.65 V to 5.5 V

Signal Descriptions

The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel.

Use the extended port function register (EPFR) to select the pin.

6. Handling Precautions

Every semiconductor device has a characteristic, inherent rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

6.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins that connect semiconductor devices to power supply and I/O functions.

1. Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

2. Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions, if present for extended periods of time, can damage the device; therefore, avoid this type of connection.

3. Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power-supply pin or ground pin.

Latch-Up

Semiconductor devices are constructed by the formation of p-type and n-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic pnpn junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred milliamps to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
2. Be sure that abnormal current flows do not occur during the power-on sequence.

Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

Fail-Safe Design

As previously mentioned, all semiconductor devices have inherent rates of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

6.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent this, do the following:

1. Avoid exposure to rapid temperature changes, which can cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
3. When Dry Packages are opened, it is recommended to have humidity between 40% and 70%.
4. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in these aluminum laminate bags for storage.
5. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons, and peripheral equipment.
3. Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ). Wearing of conductive clothing and shoes, and the use of conductive floor mats and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of Styrofoam or other highly static-prone materials for storage of completed board assemblies.

6.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

2. Discharge of static electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

3. Corrosive gases, dust, or oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

4. Radiation, including cosmic radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

5. Smoke, flame

CAUTION: Plastic molded devices are flammable and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

7. Handling Devices

Power-Supply Pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. All of these pins should be connected externally to the power supply or ground lines, however, in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Be sure to connect the current-supply source with the power pins and GND pins of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1 μF be connected as a bypass capacitor between VCC and VSS near this device.

A malfunction may occur when the power-supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the VCC power supply voltage. As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard VCC value, and the transient fluctuation rate does not exceed 0.1V/ μs at a momentary fluctuation such as switching the power supply.

Crystal Oscillator Circuit

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator (or ceramic oscillator), and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane, as this is expected to produce stable operation.

Evaluate the oscillation introduced by the use of the crystal oscillator by your mount board.

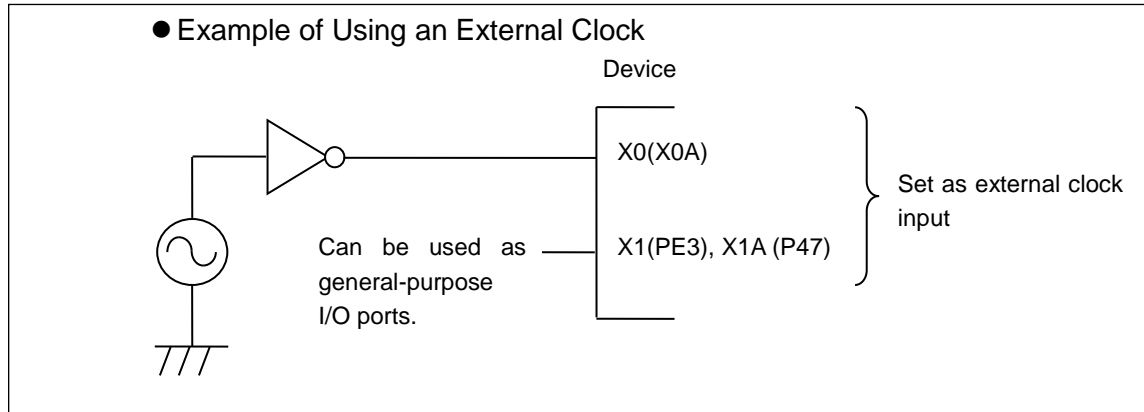

Sub Crystal Oscillator

The sub-oscillator circuit for devices in this family is low gain to keep current consumption low. To stabilize the oscillation, Cypress recommends a crystal oscillator that meets the following conditions:

- Surface mount type
 - Size: More than 3.2 mm \times 1.5 mm
 - Load capacitance: approximately 6 pF to 7 pF
- Lead type
 - Load capacitance: approximately 6 pF to 7 pF

Using an External Clock

When using an external clock as an input of the main clock, set X0/X1 to the external clock input, and input the clock to X0. X1(PE3) can be used as a general-purpose I/O port. Similarly, when using an external clock as an input of the sub clock, set X0A/X1A to the external clock input and input the clock to X0A. X1A (P47) can be used as a general-purpose I/O port.

Handling When Using Multi-Function Serial Pin as I²C Pin

If the application uses the multi-function serial pin as an I²C pin, the P-channel transistor of the digital output must be disabled. I²C pins need to conform to electrical limitations like other pins, however, and avoid connecting to live external systems with the MCU power off.

C Pin

Devices in this series contain a regulator. Be sure to connect a smoothing capacitor (C_s) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor. Some laminated ceramic capacitors have a large capacitance variation due to thermal fluctuation. Please select a capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of the device. A smoothing capacitor of about 4.7 μF would be recommended for this series.

Mode Pins (MD0)

Connect the MD pin (MD0) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistance stays low, the distance between the mode pins and VCC pins or VSS pins is as short as possible, and the connection impedance is low when the pins are pulled up/down such as for switching the pin level and rewriting the flash memory data. This is important to prevent the device from erroneously switching to test mode as a result of noise.

Notes on Power-on

Turn power on/off in the sequence shown below or at the same time. If not using the A/D converter and D/A converter, connect AVCC = VCC and AVSS = VSS.

Turning on: VBAT → VCC → USBVCC0
VBAT → VCC → USBVCC1
VCC → AVCC → AVRH
Turning off: USBVCC0 → VCC → VBAT
USBVCC1 → VCC → VBAT
AVRH → AVCC → VCC

Serial Communication

There is a possibility of receiving incorrect data as a result of noise or other issues introduced by the serial communication. Take care to design the printed circuit board to minimize noise.

Consider the case of introducing error as a result of noise, perform error detection such as by applying a checksum of data at the end. If an error is detected, retransmit the data.

Differences in Characteristics within the Product Line

The electric characteristics including power consumption, ESD, latch-up, noise, and oscillation differ among members of the product line because chip layout and memory structures are not the same; for example, different sizes, flash versus ROM, etc. If you are switching to a different product of the same series, please make sure to evaluate the electric characteristics.

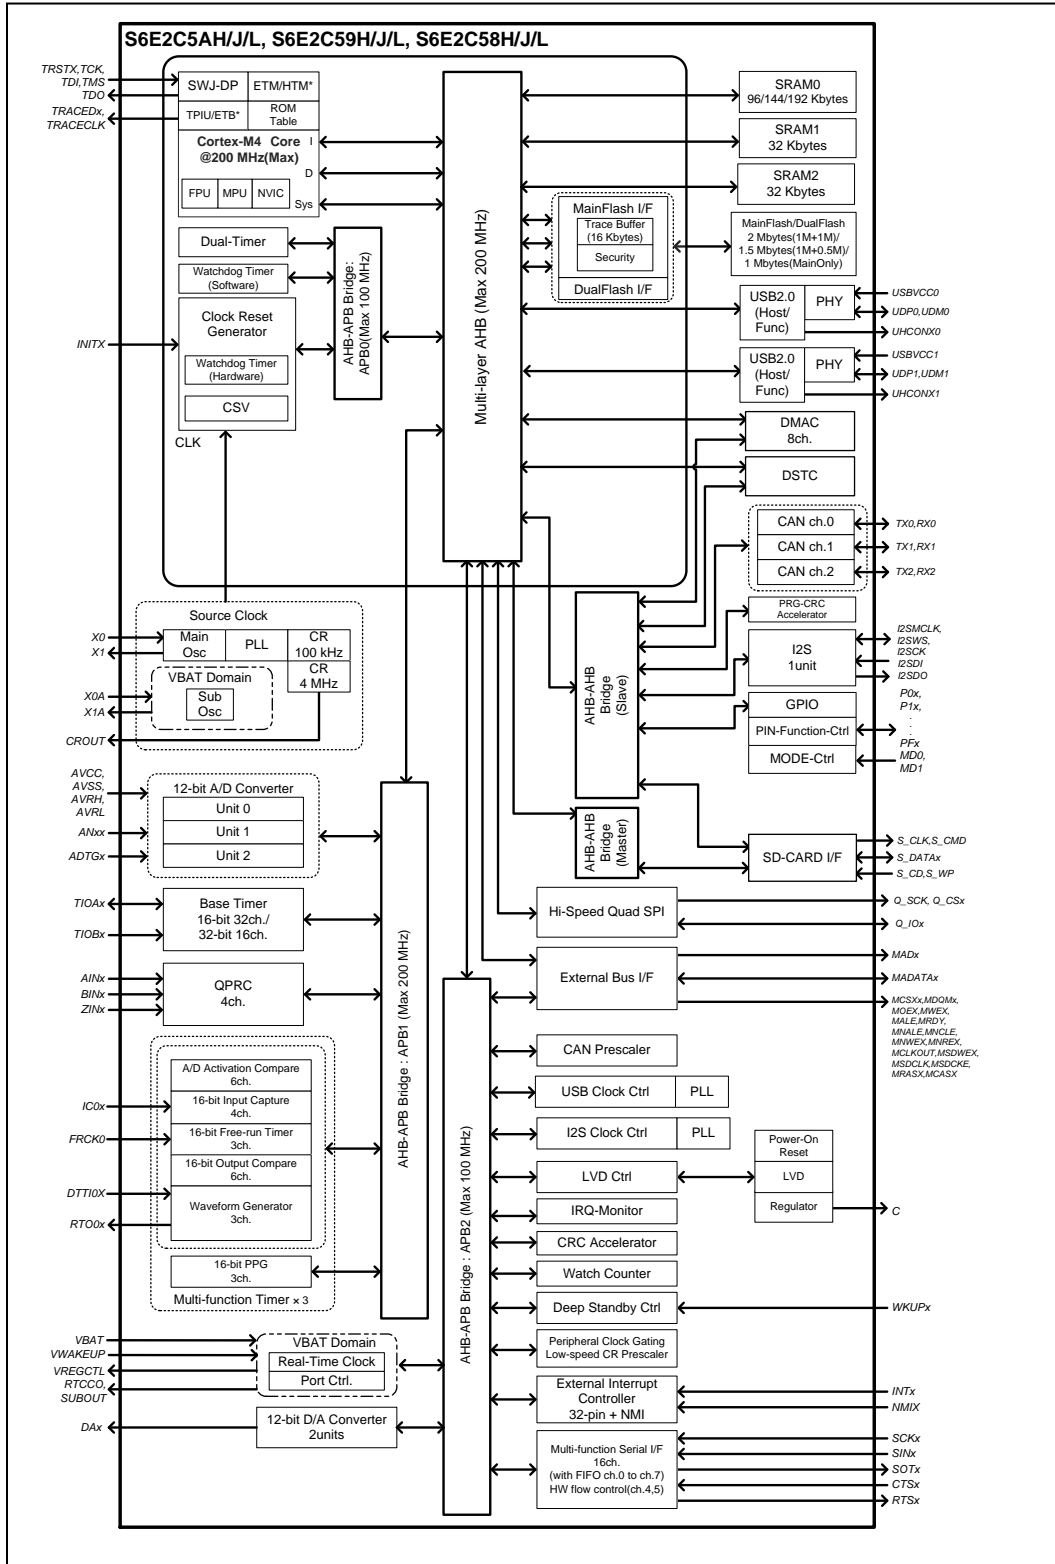

Pull-up Function of 5 V Tolerant I/O

Please do not input the signal more than VCC voltage at the time of Pull-Up function use of 5 V tolerant I/O.

Pin Doubled as Debug Function

The pin doubled as TDO/TMS/TDI/TCK/TRSTX, SWO/SWDIO/SWCLK should be used as output only. Do not use as input.

11. Pin Status in Each CPU State

The terms used for pin status have the following meanings:

- INITX = 0
This is the period when the INITX pin is at the L level.
- INITX = 1
This is the period when the INITX pin is at the H level.
- SPL = 0
This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to 0.
- SPL = 1
This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to 1.
- Input enabled
Indicates that the input function can be used.
- Internal input fixed at 0
This is the status that the input function cannot be used. Internal input is fixed at L.
- Hi-Z
Indicates that the pin drive transistor is disabled and the pin is put in the Hi-Z state.
- Setting disabled
Indicates that the setting is disabled.
- Maintain previous state
Maintains the state that was immediately prior to entering the current mode.
If a built-in peripheral function is operating, the output follows the peripheral function.
If the pin is being used as a port, that output is maintained.
- Analog input is enabled
Indicates that the analog input is enabled.
- Trace output
Indicates that the trace function can be used.
- GPIO selected
In Deep standby mode, pins switch to the general-purpose I/O port.
- Setting prohibition
Prohibition of a setting by specification limitation

1: These parameters are based on the condition that V_{SS} = AV_{SS} = 0.0 V.

2: V_{CC} must not drop below V_{SS} - 0.5 V.

3: USBV_{CC0}, USBV_{CC1} must not drop below V_{SS} - 0.5 V.

4: V_{BAT} must not drop below V_{SS} - 0.5 V.

5: Ensure that the voltage does not exceed V_{CC} + 0.5 V, for example, when the power is turned on.

6: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

- 7: The average output current is defined as the average current value flowing through any one of the corresponding pins for a 100-ms period.
- 8: The total average output current is defined as the average current value flowing through all of corresponding pins for a 100-ms period.

WARNING:

- *Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.*

- 5: The maximum temperature of the ambient temperature (T_A) can guarantee a range that does not exceed the junction temperature (T_J).

The calculation formula of the ambient temperature (T_A) is:

$$T_A (\text{Max}) = T_J(\text{Max}) - P_d(\text{Max}) \times \theta_{JA}$$

P_d : Power dissipation (W)

θ_{JA} : Package thermal resistance (°C/W)

$$P_d (\text{Max}) = V_{CC} \times I_{CC} (\text{Max}) + \sum (I_{OL} \times V_{OL}) + \sum ((V_{CC} - V_{OH}) \times (-I_{OH}))$$

I_{OL} : L level output current

I_{OH} : H level output current

V_{OL} : L level output voltage

V_{OH} : H level output voltage

- 6: The minimum value of analog reference voltage depends on the value of compare clock cycle (T_{cck}). See 12.5. 12-bit A/D Converter for the details.
- 7: For the voltage range between $V_{cc}(\text{min})$ and the low voltage detection reset (VDH), the MCU must be clocked from either the High-speed CR or the low-speed CR."

Package thermal resistance and maximum permissible power for each package are shown below. The operation is guaranteed maximum permissible power or less for semiconductor devices.

WARNING:

1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.
2. Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.
3. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet.
4. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Calculation Method of Power Dissipation (Pd)

The power dissipation is shown in the following formula.

$$P_d = V_{CC} \times I_{CC} + \sum (I_{OL} \times V_{OL}) + \sum ((V_{CC} - V_{OH}) \times (-I_{OH}))$$

I_{OL} : L level output current

I_{OH} : H level output current

V_{OL} : L level output voltage

V_{OH} : H level output voltage

I_{CC} is the current drawn by the device.

It can be analyzed as follows.

$$I_{CC} = I_{CC}(\text{INT}) + \sum I_{CC}(\text{IO})$$

$I_{CC}(\text{INT})$: Current drawn by internal logic and memory, etc. through the regulator

$\sum I_{CC}(\text{IO})$: Sum of current (I/O switching current) drawn by the output pin

For $I_{CC}(\text{INT})$, it can be anticipated by (1) Current Rating in 12.3. DC Characteristics (This rating value does not include $I_{CC}(\text{IO})$ for a value at pin fixed).

For $I_{CC}(\text{IO})$, it depends on system used by customers.

The calculation formula is shown below.

$$I_{CC}(\text{IO}) = (C_{\text{INT}} + C_{\text{EXT}}) \times V_{CC} \times f_{\text{SW}}$$

C_{INT} : Pin internal load capacitance
 C_{EXT} : External load capacitance of output pin
 f_{SW} : Pin switching frequency

Parameter	Symbol	Conditions	Capacitance Value
Pin internal load capacitance	C_{INT}	4 mA type	1.93 pF
		8 mA type	3.45 pF
		12 mA type	3.42 pF

Calculate $I_{CC}(\text{Max})$ as follows when the power dissipation can be evaluated by yourself:

Measure current value $I_{CC}(\text{Typ})$ at normal temperature (+25°C).

Add maximum leakage current value $I_{CC}(\text{leak_max})$ at operating on a value in (1).

$$I_{CC}(\text{Max}) = I_{CC}(\text{Typ}) + I_{CC}(\text{leak_max})$$

Parameter	Symbol	Conditions	Current Value
Maximum leakage current at operating	$I_{CC}(\text{leak_max})$	$T_J = +125^\circ\text{C}$	79.2 mA
		$T_J = +105^\circ\text{C}$	39.4 mA
		$T_J = +85^\circ\text{C}$	26.5 mA

				384	MHz	I ² S
USB clock frequency ²	f _{CLKPLL}	-	-	50	MHz	After the M frequency division
I ² S clock frequency ³	f _{CLKPLL}	-	-	12.288	MHz	After the M frequency division

- 1: Time from when the PLL starts operating until the oscillation stabilizes
- 2: For more information about USB/Ethernet clock, see Chapter 2-2: USB/Ethernet Clock Generation in FM4 Family Peripheral Manual Communication Macro Part (002-04862).
- 3: For more information about I²S clock, see Chapter 7-1: I²S Clock Generation in FM4 Family Peripheral Manual Communication Macro Part (002-04862).

12.4.6 Operating Conditions of Main PLL (in the Case of Using Built-in High-speed CR Clock for Input Clock of Main PLL)

($V_{CC} = 2.7V$ to $5.5V$, $V_{SS} = 0V$)

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
PLL oscillation stabilization wait time ¹ (lock up time)	t_{LOCK}	100	-	-	μs	
PLL input clock frequency	f_{PLLI}	3.8	4	4.2	MHz	
PLL multiplication rate	-	50	-	95	multiplier	
PLL macro oscillation clock frequency	f_{PLLO}	190	-	400	MHz	
Main PLL clock frequency ²	f_{CLKPLL}	-	-	200	MHz	

1: Time from when the PLL starts operating until the oscillation stabilizes

2: For more information about Main PLL clock (CLKPLL), see Chapter 2-1: Clock in FM4 Family Peripheral Manual Main Part (002-04856).

Note:

- The High-speed CR clock (CLKHC) should be set with frequency/temperature trimming to act as the source clock of the Main PLL.

12.4.7 Reset Input Characteristics

($V_{CC} = 2.7V$ to $5.5V$, $V_{SS} = 0V$)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Typ		
Reset input time	t_{INITX}	INITX	-	500	-	ns	

12.4.8 Power-On Reset Timing

1: R and C_L represent the pull-up resistance and load capacitance of the SCL and SDA lines, respectively. V_p indicates the power supply voltage of the pull-up resistance and I_{OL} indicates V_{OL} guaranteed current.

2: The maximum t_{HDDT} must not extend beyond the low period (t_{LOW}) of the device's SCL signal.

3: Fast-mode I²C bus device can be used on a Standard-mode I²C bus system as long as the device satisfies the requirement of "t_{SUDAT} ≥ 250 ns."

4: t_{CYCP} is the APB bus clock cycle time. For more information about the APB bus number to which the I²C is connected, see "8.Block Diagram" in this data sheet.

When using Standard-mode, the peripheral bus clock must be set more than 2 MHz.

When using Fast-mode, the peripheral bus clock must be set more than 8 MHz.

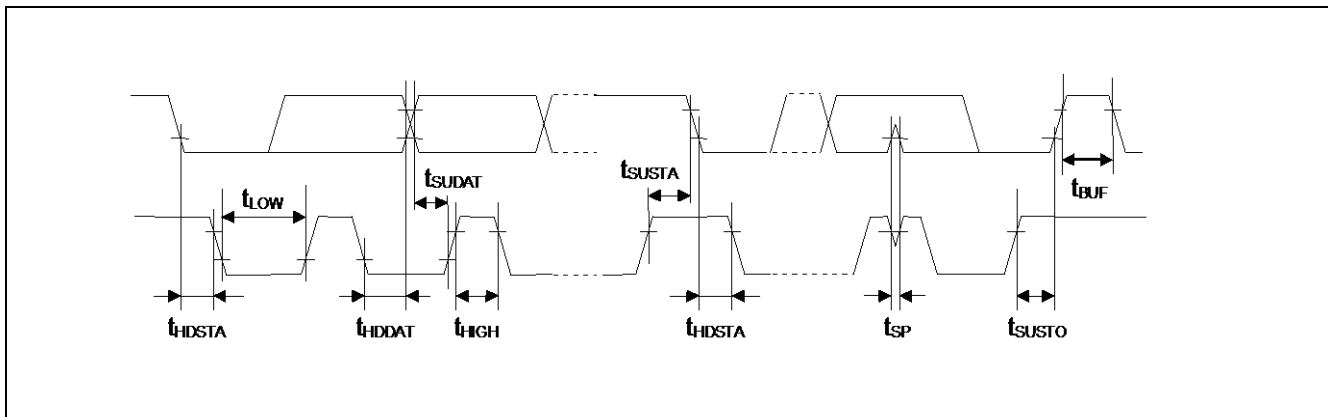

5: The noise filter time can be changed by register settings. Change the number of the noise filter steps according to the APB bus clock frequency.

Fast Mode Plus (Fm+)

 ($V_{CC} = 2.7V$ to $5.5V$, $V_{SS} = 0V$)

Parameter	Symbol	Conditions	Fast Mode Plus (Fm+)*6		Unit	Remarks
			Min	Max

SCL clock L width	t_{LOW}		0.5	-	μs	
SCL clock H width	t_{HIGH}		0.26	-	μs	
SCL clock frequency	t_{SUSTA}		0.26	-	μs	
(Repeated) START condition hold time SDA ↓ → SCL ↓	t_{HDDAT}		0	$0.45^{*2, *3}$	μs	
Data setup time SDA ↓ ↑ → SCL ↑	t_{SUDAT}		50	-	ns	
Stop condition setup time SCL ↑ → SDA ↑	t_{SUSTO}		0.26	-	μs	
Bus free time between "Stop condition" and "START condition"	t_{BUF}		0.5	-	μs	
Noise filter	t_{SP}		$60\text{ MHz} \leq t_{CYCP} < 80\text{ MHz}$	$6 t_{CYCP}^{*4}$	-	ns
		$80\text{ MHz} \leq t_{CYCP} \leq 100\text{ MHz}$	$8 t_{CYCP}^{*4}$	-	ns	

- 1: R and C_L represent the pull-up resistance and load capacitance of the SCL and SDA lines, respectively. V_p indicates the power supply voltage of the pull-up resistance and I_{OL} indicates V_{OL} guaranteed current.
- 2: The maximum t_{HDDT} must not extend beyond the low period (t_{LOW}) of the device's SCL signal.
- 3: The Fast mode I²C bus device can be used on a Standard-mode I²C bus system as long as the device satisfies the requirement of " $t_{SUDAT} \geq 250\text{ ns}$."
- 4: t_{CYCP} is the APB bus clock cycle time. For more information about the APB bus number to which the I²C is connected, see "8. Block Diagram" in this data sheet.
To use fast mode plus (Fm+), set the peripheral bus clock at 64 MHz or more.
- 5: The noise filter time can be changed by register settings. Change the number of the noise filter steps according to the APB bus clock frequency.
- 6: When using fast mode plus (Fm+), set the I/O pin to the mode corresponding to I²C Fm+ in the EPFR register. See Chapter12: I/O PORT in FM4 Family Peripheral Manual Main Part (002-04856) for the details.

12.4.16 SD Card Interface Timing

Default-Speed Mode

■ Clock CLK (All values are referenced to V_{IH} and V_{IL} transition points)

($V_{CC} = 2.7V$ to $3.6V$, $V_{SS} = 0V$)

Parameter	Symbol	Pin Name	Conditions	Value		Remarks
				Min	Max	
Clock frequency Data Transfer Mode	f_{PP}	S_CLK	$C_{CARD} \leq 10$ pF (1card)	0	25	MHz

1: The conversion time is the value of sampling time (T_s) + compare time (T_c).

The condition of the minimum conversion time is when the value of T_s = 150 ns and T_c = 350 ns (AV_{CC} ≥ 4.5V). Ensure that it satisfies the value of sampling time (T_s) and compare clock cycle (T_{CCK}). For setting of sampling time and compare clock cycle, see Chapter 1-1: A/D Converter in FM4 Family Peripheral Manual Analog Macro Part (002-04860). The register setting of the A/D converter is reflected by the APB bus clock timing. For more information about the APB bus number to which the A/D converter is connected, see 8. Block Diagram in this data sheet.

The sampling and compare clock are set at base clock (HCLK).

2: A necessary sampling time changes by external impedance. Ensure that it sets the sampling time to satisfy (Equation 1).

3: The compare time (T_c) is the value of (Equation 2).

(Equation 1) $T_s \geq (R_{AIN} + R_{ext}) \times C_{AIN} \times 9$

t_s : Sampling time

R_{AIN} : Input resistance of A/D = 1.2 k Ω at 4.5V $\leq AV_{CC} \leq$ 5.5V

Input resistance of A/D = 1.8 k Ω at 2.7V $\leq AV_{CC} <$ 4.5V

C_{AIN} : Input capacity of A/D = 12.05 pF at 2.7V $\leq AV_{CC} \leq$ 5.5V

R_{ext} : Output impedance of external circuit

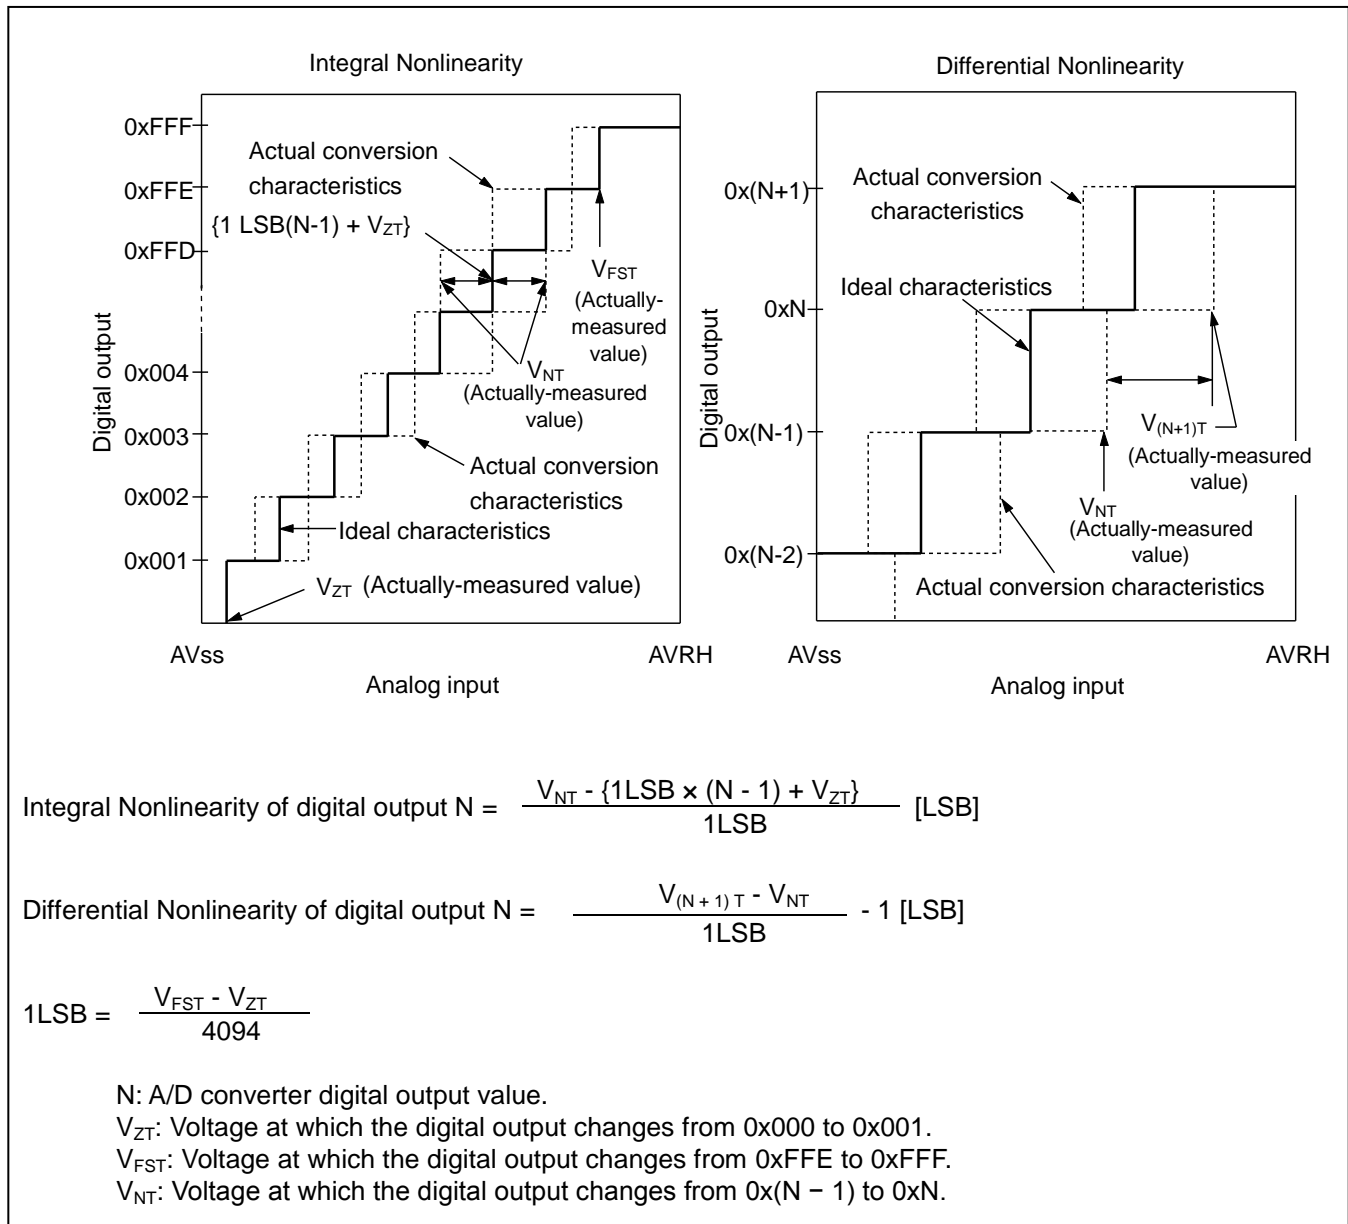

(Equation 2) $T_c = T_{cck} \times 14$

t_c : Compare time

t_{cck} : Compare clock cycle

Definition of 12-bit A/D Converter Terms

- Resolution: Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity: Deviation of the line between the zero-transition point (0b000000000000 ↔ 0b000000000001) and the full-scale transition point (0b111111111110 ↔ 0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity: Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

1: The switching threshold voltage of the single-end-receiver of USB I/O buffer is set as within V_{IL} (Max) = 0.8 V, V_{IH} (Min) = 2.0 V (TTL input standard).

There is some hysteresis applied to lower noise sensitivity.

2: Use differential-receiver to receive USB differential data signal. Differential-receiver has 200 mV of differential input sensitivity when the differential data input is within 0.8V to 2.5V to the local ground reference level.

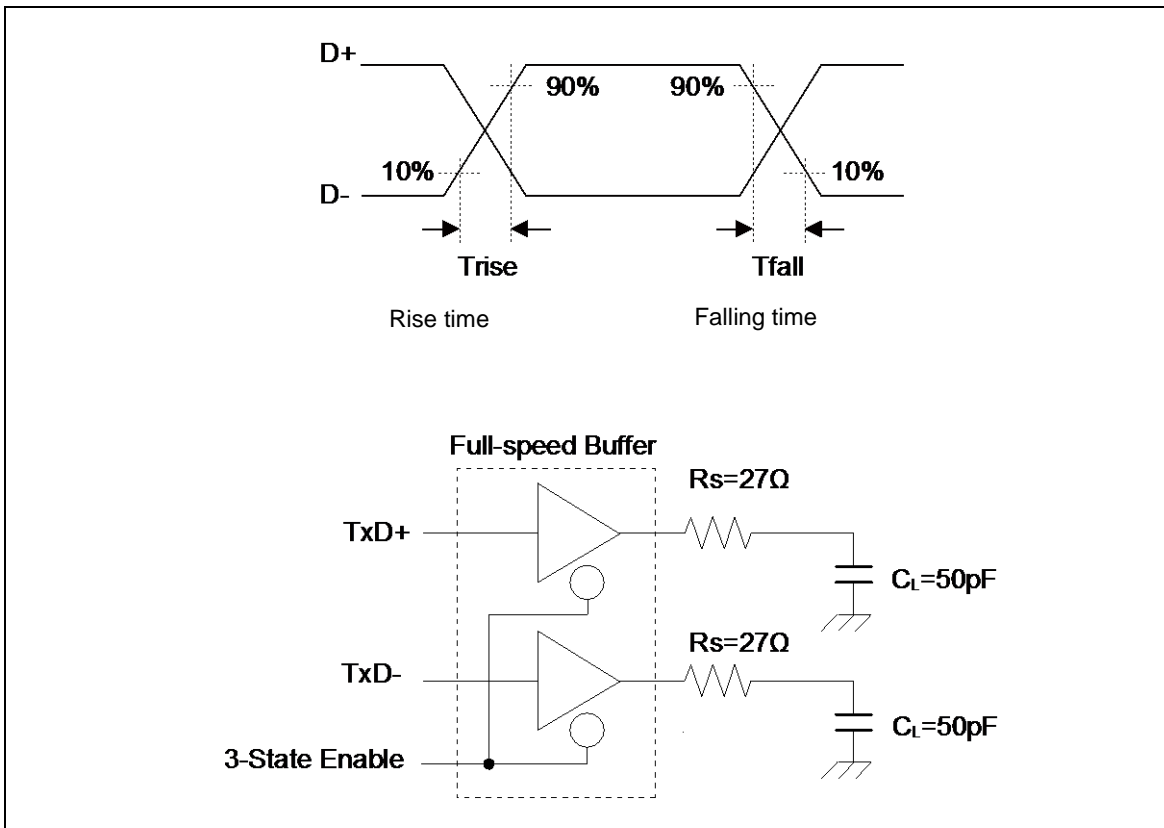

Above voltage range is the common mode input voltage range.

- 3: The output drive capability of the driver is below 0.3 V at low state (V_{OL}) (to 3.6 V and 1.5 k Ω load), and 2.8 V or above (to the VSS and 1.5 k Ω load) at high state (V_{OH}).
- 4: The cross voltage of the external differential output signal (D +/D -) of USB I/O buffer is within 1.3 V to 2.0 V.

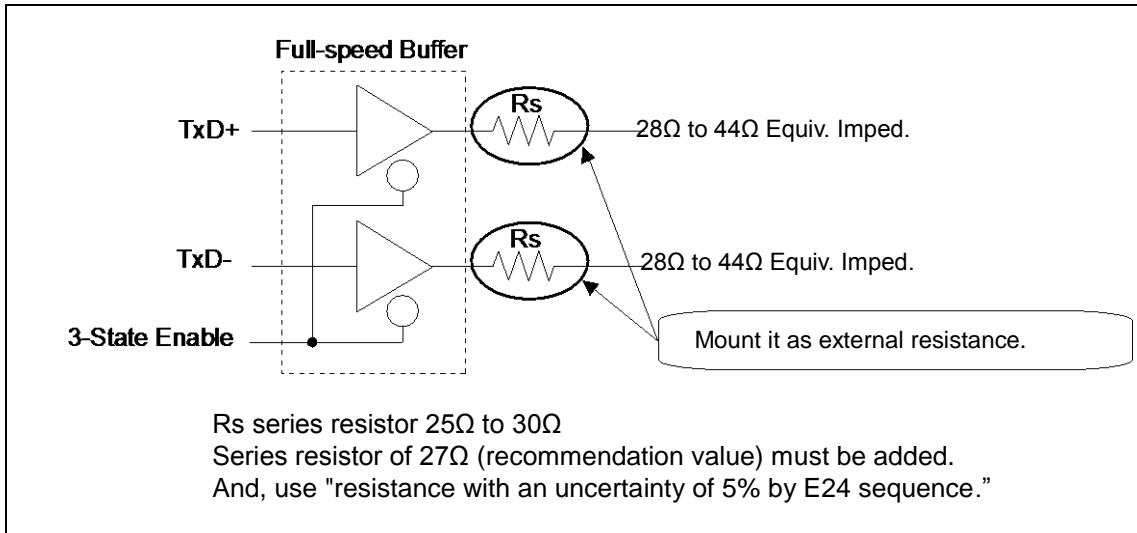

- 5: They indicate rise time (T_{RISE}) and fall time (T_{FALL}) of the full-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage. For full-speed buffer, T_R/T_F ratio is regulated as within $\pm 10\%$ to minimize RFI emission.

6: USB Full-speed connection is performed via twisted-pair cable shield with $90\ \Omega \pm 15\%$ characteristic impedance (differential mode).

USB standard defines that the output impedance of the USB driver must be in the range from $28\ \Omega$ to $44\ \Omega$. So, a discrete series resistor (R_s) addition is defined in order to satisfy the above definition and keep balance.

When using this USB I/O, use it with $25\ \Omega$ to $30\ \Omega$ (recommended value $27\ \Omega$) series resistor R_s .

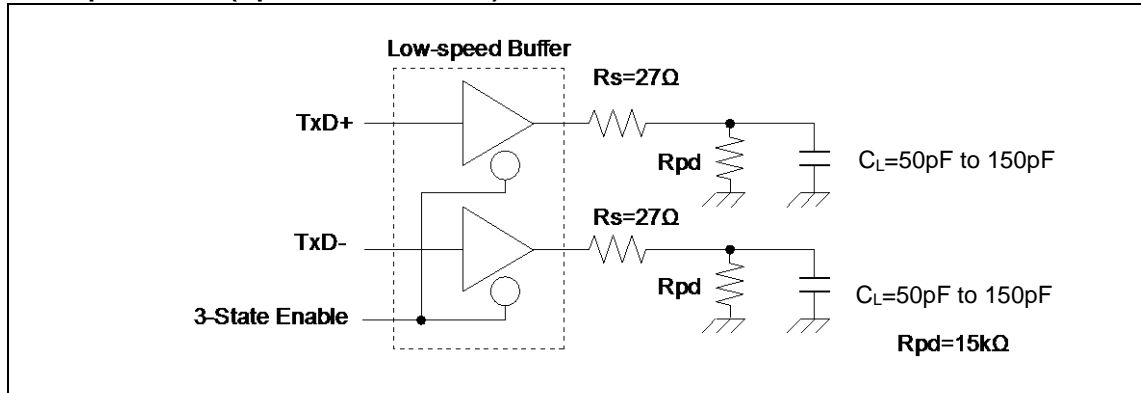

7: They indicate rise time (T_{rise}) and fall time (T_{fall}) of the low-speed differential data signal. They are defined by the time between 10% and 90% of the output signal voltage.

	Write cycles > 100 times			200		
Chip erase time*		-	13.6	68	s	Includes write time prior to internal erase

*: It indicates the chip erase time of 1MB MainFlash memory

For devices with 1.5 MB or 2 MB of MainFlash memory, two erase cycles are required.

See 3.2.2 Command Operating Explanations and 3.3.3 Flash Erase Operation in this product's Flash Programming Manual for the detail.

Write Cycles and Data Retention Time

Erase/Write Cycles (Cycle)	Data Retention Time (Year)
1,000	20*
10,000	10*
100,000	5*

*: This value comes from the technology qualification (using Arrhenius equation to translate high temperature acceleration test result into average temperature value at + 85°C).

12.10 Dual Flash Memory Write/Erase Characteristics

It is the same write/erase characteristics as the MainFlash memory.

See 3.6 Dual flash mode in this product's Flash Programming Manual for the detail of dual flash mode.

12.11 Standby Recovery Time

12.11.1 Recovery cause: Interrupt/WKUP

The time from the interrupt occurring to the time of program operation start is shown.

Deep Standby RTC mode with RAM retention Deep Standby Stop mode with RAM retention		365	667	μs	without RAM retention
		365	667	μs	with RAM retention

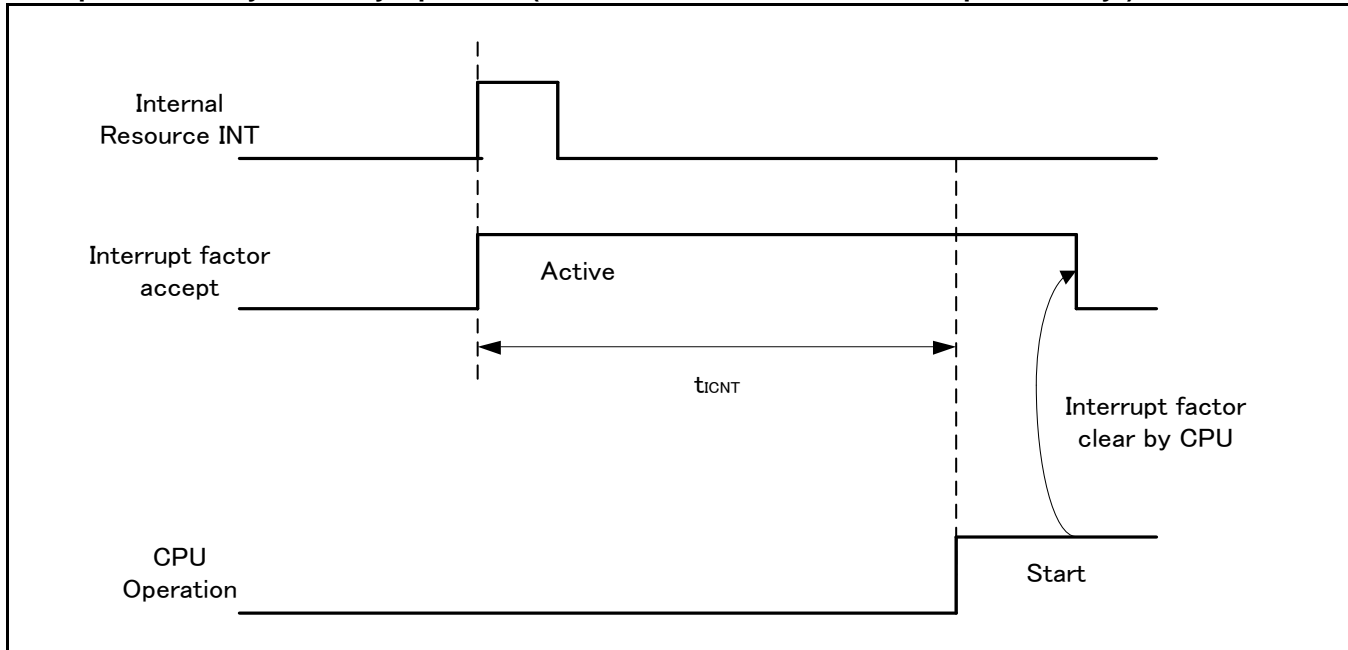

*: The maximum value depends on the built-in CR accuracy.

Example of Standby Recovery Operation (when in External Interrupt Recovery*)

*: External interrupt is set to detecting fall edge.

Example of Standby Recovery Operation (when in Internal Resource Interrupt Recovery*)

*: Depending on the standby mode, interrupt from the internal resource is not included in the recovery cause.

Notes:

- The return factor is different in each low-power consumption mode. See Chapter 6: Low Power Consumption Mode and Operations of Standby Modes in FM4 Family Peripheral Manual Main Part (002-04856).
- The recovery process is unique for each operating mode. See Chapter 6: Low Power Consumption Mode in FM4 Family Peripheral Manual Main Part (002-04856).

12.11.2 Recovery Cause: Reset

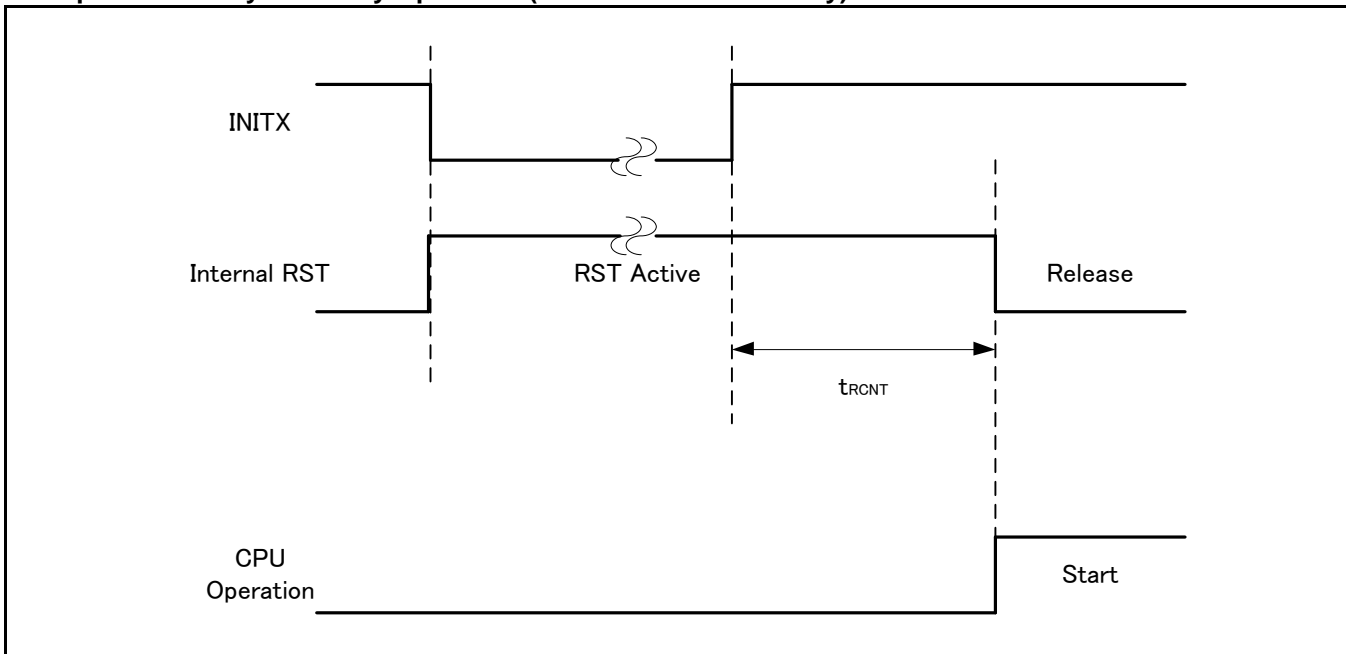

The time from reset release to the program operation start is shown.

Recovery Count Time

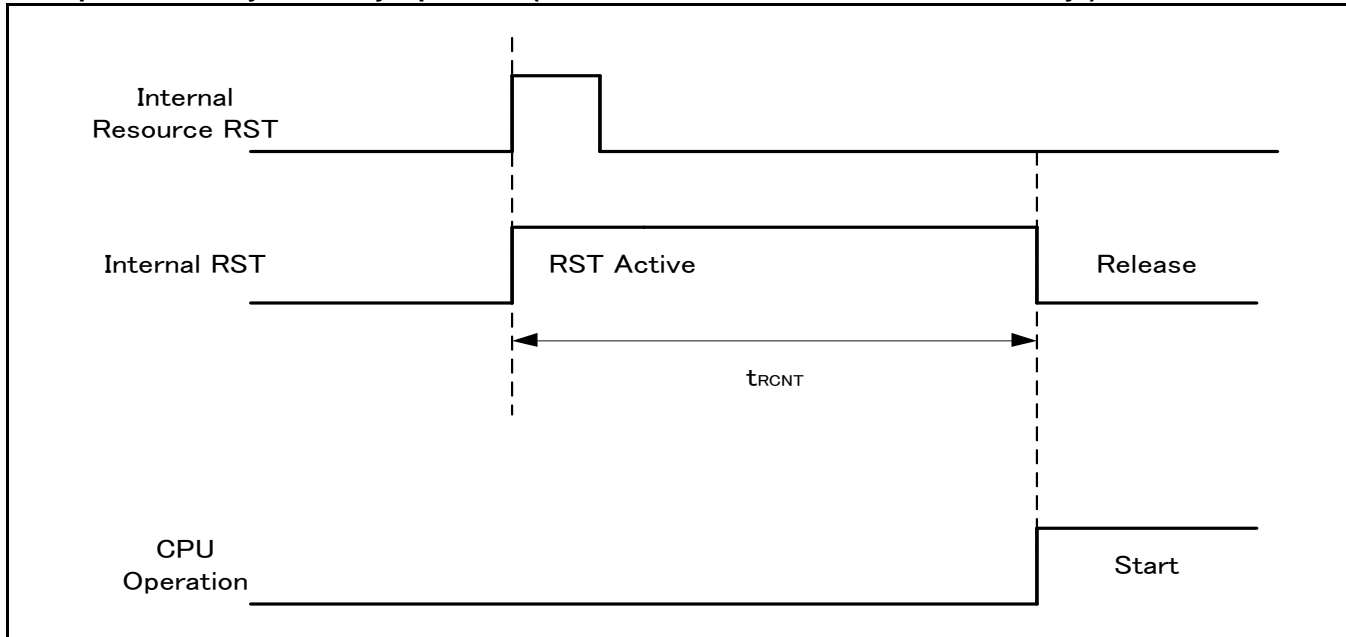

($V_{CC} = 2.7V$ to $5.5V$, $V_{SS} = 0V$)

Parameter	Symbol	Value		Unit	Remarks

Deep Standby RTC mode with RAM retention Deep Standby Stop mode with RAM retention		336	667	μs	without RAM retention
		336	667	μs	with RAM retention

*: The maximum value depends on the built-in CR accuracy.

Example of Standby Recovery Operation (when in INITX Recovery)

Example of Standby Recovery Operation (when in Internal Resource Reset Recovery*)

*: Depending on the low-power consumption mode, the reset issue from the internal resource is not included in the recovery cause.

Notes:

- The return factor is different in each low power consumption mode. See Chapter 6: Low Power Consumption Mode and Operations of Standby Modes in FM4 Family Peripheral Manual Main Part (002-04856).
- The recovery process is unique for each operating mode. See Chapter 6: Low Power Consumption Mode in FM4 Family Peripheral Manual Main Part (002-04856).
- When the power-on reset/low-voltage detection reset, they are not included in the return factor. See 12.4.8 Power-On Reset Timing.
- In recovering from reset, CPU changes to High-speed Run mode. In the case of using the main clock and PLL clock, they need further main clock oscillation stabilization wait time and oscillation stabilization wait time of Main PLL clock.
- Internal resource reset indicates Watchdog reset and CSV reset.

97-105	13. Pin Status In Each CPU State	Deleted X and Y in Pin Status Type.
106-107	14.1. Absolute Maximum Ratings	Added 10 mA type.
108-111	14.2. Recommended Operating Conditions	Added AVRL in Analog reference voltage. Revised the leakage current in Maximum leakage current at operating
112-121	14.3.1. Current Rating	Revised the maximum current of each category.
122-123	14.3.2. Pin Characteristics	Added the characteristic of external bus in H level input voltage (hysteresis input). Added the characteristic of 10 mA type.
126	14.4.5. Operating Conditions of USB PLL · I2S PLL (in the case of using main clock for input clock of PLL)	Revised the maximum of I2S PLL macro oscillation clock frequency. (307.2 MHz→384 MHz)
190	14.5.12-bit A/D Converter	Revised the minimum of Sampling time. Revised the characteristic of State transition time to operation permission Added AVRL in Analog reference voltage.
198	14.8.2. Interrupt of Low-Voltage Detection	Revised the SVHI values in Conditions

NOTE: Please see “Document History” about later revised information.

Document History

Document Title: S6E2C5 Series 32-bit ARM® Cortex®-M4F, FM4 Microcontroller

Document Number: 002-04984

Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	-	AKIH	04/22/2015	New Spec.
*A	5126421	HITK	02/08/2016	Company name and layout design change. Added the note of TAP pin. Updated Package Code and Dimensions (LQFP-144, LQFP-176, LQFP-216).
