

User Manual GreenPAK Advanced Development Platform UM-GP-002

Abstract

This user manual provides basic guidelines for the developers to get familiar with the GreenPAK Advanced Development Platform. It gives an overview of the hardware, as well as the functional description of this platform, and shows the example projects using SLG46721.

2 Introduction

Thank you for choosing Dialog Semiconductor products. The GreenPAK Advanced Development Platform allows you to develop your custom design using GreenPAK mixed signal ICs. You can design your own projects starting from a blank project or by altering the sample projects provided at https://www.dialog-semiconductor.com/.

2.1 GreenPAK Designer

GreenPAK Designer is an easy-to-use full-featured integrated development environment (IDE) that allows you to specify exactly how you want the device to be configured. This provides you a direct access to all GreenPAK device features and complete control over the routing and configuration of a PAK project with just one tool.

With GreenPAK Designer, you can:

- Design the configuration which corresponds to your project needs
- Verify the project using software interface to GreenPAK Advanced Development Platform hardware
- With simple-to-use and intuitive software and hardware tools you can reduce your project development time and get to market faster

To start working with GreenPAK Designer please take the following steps:

- Download and install GreenPAK Designer software
- Configure modules that you will need for your project
- Interconnect and configure modules
- Specify the pin out
- Test your design with the GreenPAK Advanced Development Platform

2.2 Support

Free support for GreenPAK Advanced Development Platform is available online at https://www.dialog-semiconductor.com/.

At facebook : https://www.facebook.com/dialogsemi/.

GreenPAK Designer will automatically notify you when a new version of software is available. For manual updates please go to https://www.dialog-semiconductor.com/greenpak-designer-software.

These resources are also available under the **Help** menu of GreenPAK Designer.

User Manual

3 Getting Started

3.1 Introduction

This chapter describes how to install and configure the GreenPAK Advanced Development Platform. Section 4 provides the details of hardware operation. Section 5 provides instructions on how to create a simple project example.

3.2 Install Hardware

No hardware installation is required for this platform.

3.3 Install Software

GreenPAK Designer software is available free of charge from the Dialog website at https://www.dialog-semiconductor.com/greenpak-designer-software page.

3.4 Uninstall Software

The software can be uninstalled in the way typical for your operating system. Please refer to your operating system support documentation if you need the specific instructions or visit Section 2.2 of this document for additional support from Dialog.

4 Hardware

4.1 Overview

Figure 1: GreenPAK Advanced Development Board, Top View

Note: all test points were designed only for observation of signals on the pins. Please do not try to connect external power/signal source to test points, this will affect GreenPAK Advanced Development Board functionality and may even damage it.

4.2 Functional Description

4.2.1 Power Supply

The main power source of the GreenPAK Advanced Development Board is the USB power line. The Development Board can deliver power from 0 to 5.5 V. To provide this power range, the Development Board is equipped with a boost converter. A Signal generator with a buffered output controls the GreenPAK chip power rail. For more information about GreenPAK electrical specification, please refer to the datasheet.

| User Manual | Revision 2.2 | 21-Feb- |
|-------------|--------------|---------|

-2020

4.2.2 USB Communication

The board has the USB communications interface that uses the USB mini-B connector, as shown in Figure 2. This interface provides communication with the software control tool and supplies power to the platform, as discussed in 4.2.1.

Figure 2: USB Interface

4.2.3 GND Connections

There are 6 GND pins on the left side, 6 pins and 1 header on the right side. These can be used for test equipment (oscilloscope, multimeter, and others) ground reference connection or to connect external test circuitry ground.

4.2.4 Pin Test Points

Each GreenPAK chip pin including V_{DD} has its own observation test point. These test points were designed only for observation. To connect an external signal source use a software-controlled expansion connector.

4.2.5 LEDs

All the pins except Pin 2 can be connected to buffered LEDs. This option allows visualization of digital levels on chip pins. There are 2 selection modes:

- Buffered LED (with high impedance input)
- Inverted Buffered LED (with high impedance input)

This option can be enabled in GreenPAK Designer.

4.2.6 Socket Connector

The GreenPAK Advanced Development Board should be used with a detachable socket board. Its main purpose is to connect the GreenPAK chip to the Development Board. It's easy to use the programmed chip in external circuits, or to measure current consumption of the project.

4.2.7 Expansion Connector

This port was designed to connect the GreenPAK Advanced Development Board to external circuits and apply external power, signal sources and loads. It can be used to apply the GreenPAK chip into your custom design with minimal additional tools. For schematic diagram refer to Figure 3.

Figure 3: GreenPAK Expansion Connector Schematic

Each pin except Pin 11 (GND) is controlled through an individual analog switch. Expansion connector is a standard 0.1" double row connector. GreenPAK Designer can enable or disable external pins, as it is shown in the Figure 4. The main purpose of the Expansion connector is to connect an external signal/power source safely to the GreenPAK Advanced Development Board.

| 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 | 18 | 20 | Vb | 22 | 24 | 26 | 28 | 30 | 32 |

Figure 4: Expansion Connector Control in GreenPAK Designer

Figure 5 demonstrates the schematic diagram of the expansion connector control.

GreenPAK Advanced Development Platform

Figure 5: Socket and Expansion Connector Schematic

Expansion connector is enabled only in Emulation mode or Test mode. To enter either of these two modes the GreenPAK chip must be in the socket. When the Test mode button is pressed the software will first read the chip to verify if it was inserted and then configure the GreenPAK Advanced Development Board as set in Emulation Tool window. When the Test mode button is gray then the Development Platform is in Default state and all expansion port switches are open (disconnected). After Emulation button is pressed, the software will automatically perform the following steps:

- check chip presence
- open all expansion port switches (external signals/loads can be left connected to expansion port)
- use internal power and load configuration to the chip
- only for case #3: adjust internal power source to external power level → close external power switch → open internal power switch
- configure Development Board as set in Emulation Tool window

Parasitic effects should be also considered while using the GreenPAK Advanced Development Board in-circuit with analog signals. The entire Development Board circuitry along with the wiring have a significant amount of mutual capacitance and inductance. The detachable socket can also be used for the in-circuit development with programmed chips (the Development Board and socket connectors have the same pinout).

The GreenPAK Advanced Development Board provides three possible ways of using expansion connector:

1) Internal power is used to run the chip, no external power output is needed, external signal sources and loads can be connected between pins and GND.

| User Manual | Revision 2.2 | 21-Feb-2020 |
|-------------|--------------|-------------|
| User Manual | Revision 2.2 | 21-Feb-2020 |

GreenPAK Advanced Development Platform

The configuration steps:

- close internal and open external power switch
- close all used expansion port switches in the software
- hit Emulation/Test mode button

This is the common way of using an Expansion connector.

| 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 | 18 | 20 | Vb | 22 | 24 | 26 | 28 | 30 | 32 |

| Int | Int. VDD Ext. VDD ON OFF | | | | | | | | | | | | TP | Мар | | |
| | | | | | | LED | s ON | | LEDs | OFF | | | | | | |

Figure 6: Internal Power Source

2) Internal power is used to run the chip and external circuit (internal power source/sink current is limited to 50 mA).

The configuration steps:

- close internal power switch
- close external power switch
- close all used expansion port switches in the software
- hit Emulation/Test mode button

Figure 7: Internal Power Source for GreenPAK Chip and External Development Platform

3) External power is used to run the chip and external circuit (internal source output is in Hi-Z state). The configuration steps:

- open internal power switch
- close external power switch
- close all used expansion port switches in the software
- hit Emulation/Test mode button (External power should be applied before this step)

Note that the GreenPAK chip has internal OTP memory which is normally loaded into RAM registers at initialization time. "Emulation mode" will bypass this load, and write the updated version of the project directly into the RAM register inside the GreenPAK chip many times, but after power loss all internal data will be lost. When the GreenPAK chip is already programmed the user can use Emulation mode to load another project and test it on the emulation tool in Emulation mode, in that case emulation data will be cleared. The "Emulation" mode is not necessary for checking programmed parts: in this case the "Test mode" is used.

Expansion connector can be divided by types of connections:

- 1. Vdd
- 2. GND
- 3. Data connections

The V_{DD} connection enables the user to connect/disconnect external and internal power source. This connection meets next requirements:

- External power range: 1.8 5.5 V
- High resistance voltage dividers are not recommended

User Manual

The GND connection is connected directly to the Development Board, and cannot be controlled by GreenPAK Designer.

Data connections are the easiest way to connect external lines to the GreenPAK chip. They are software controlled switches. Every line is connected with a 100 W resistor.

Figure 8: Expansion Connector. Pin with Protection Resistor

4.2.8 Pins Connectivity

The GreenPAK Advanced Development Board supports connecting eight types of loads and signal sources. Each source has its own special purpose. The List of available connections for each test point is presented in Table 1.

| Pin | Set to VDD | Set to GND | Pull-up | Pull-down | Set Configurable Button | LED | Signal Generator | Logic Generator |
|-----------------|------------|------------|---------|-----------|-------------------------------|-----|---------------------|--------------------|

Table 1: Available Connections for Each Test Point

Figure 9: Pin Signal Sources/Loading Schematics

Note: V_{DD} Signal generator works similar to other Signal generators but has wider output voltage range. It can provide maximum supply level of 5.5 V.

GreenPAK Advanced Development Platform

5 Example Projects using SLG46721

5.1 **Project: Counter with Clock Enable**

Blocks required:

- 2 digital inputs
- 1 digital output
- 1 Look Up Table with two inputs
- 1 Counter

Figure 12: Pin 20 Mode

GreenPAK Advanced Development Platform

The next component in this design is the Look Up Table. First Look Up Table (LUT4) is used to generate logic "1" only when there are high logic levels on both inputs (AND gate). Select AND gate from "Standard gates" drop-down menu or set table manually. Second Look Up Table (LUT5) is configured as NOR gate. It is used to generate reset signal for counter on Pin 3 falling edge.

GreenPAK Advanced Development Platform

Use the GreenPAK Advanced Development Board to test this project. Connect the GreenPAK Advanced Development Board to the PC and press "Emulation" button. This will load the code of your project to the chip and will enable Test functionality of your Development Board.

Figure 17: GreenPAK Designer, Emulation Tool

To test this project we will use the following tools:

- Signal generator. Signal generator is applied to V_{DD} pin to power GreenPAK chip
- Logic generator. Logic generator serves as clock source
- Button is a software simulation of the real button. It switches Pin between V_{DD} and GND signal levels
- Inverted buffered LED
- Buffered LED

Figure 18: Signal Generator Connected to V_{DD} Pin

Signal generator is presented as a power source for GreenPAK chip. It's configured to output source constant 3.3 V.

Figure 19: Signal Generator Settings

The purpose of the logic generator is to provide clock pulses for the Counter block. It is configured for 10 Hz clock source as shown in the Figure 20.

5.2 Project: LED String with Direction

For this project we will need:

- Analog pin for input data
- Digital pin for PWM output
- ADC block
- PWM block

Figure 24: Used Blocks for Current Project

For testing this project, the Signal generator with sine waveform is used.

Figure 30: ACMP Properties

Pins 15, 17, 19 - configured as output with Push-Pull 1x. They are used for testing purpose.

All comparators positive inputs are connected to the Pin 6 analog input. When the voltage on the positive input is higher than the voltage on the negative input, comparator will set logic "1" on its output. ACMP0 positive input is 200 mV, ACMP1 is 500 mV, and ACMP2 is 800 mV, creating 4 states:

- All LEDs are off
- LED_A is on
- LED_A and LED_B are on
- All LEDs are on

If Pin 2 logic level is set to "1", these states will transform into:

- All LEDs are on
- LED_A and LED_B are on
- LED_A is on
- All LEDs are off

GreenPAK Advanced Development Platform

6 Conclusion

This Development Platform is a truly versatile tool. It allows the designer to create a custom project within minutes, without using additional devices (except oscilloscope).

Disclaimer

Unless otherwise agreed in writing, the Dialog Semiconductor products (and any associated software) referred to in this document are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of a Dialog Semiconductor product (or associated software) can reasonably be expected to result in personal injury, death or severe property or environmental damage. Dialog Semiconductor and its suppliers accept no liability for inclusion and/or use of Dialog Semiconductor product (or applications and therefore such inclusion and/or use is at the customer's own risk.

Information in this document is believed to be accurate and reliable. However, Dialog Semiconductor does not give any representations or warranties, express or implied, as to the accuracy or completeness of such information. Dialog Semiconductor furthermore takes no responsibility whatsoever for the content in this document if provided by any information source outside of Dialog Semiconductor.

Dialog Semiconductor reserves the right to change without notice the information published in this document, including, without limitation, the specification and the design of the related semiconductor products, software and applications. Notwithstanding the foregoing, for any automotive grade version of the device, Dialog Semiconductor reserves the right to change the information published in this document, including, without limitation, the specification and the design of the related semiconductor products, software and applications published in this document, including, without limitation, the specification and the design of the related semiconductor products, software and applications, in accordance with its standard automotive change notification process.

Applications, software, and semiconductor products described in this document are for illustrative purposes only. Dialog Semiconductor makes no representation or warranty that such applications, software and semiconductor products will be suitable for the specified use without further testing or modification. Unless otherwise agreed in writing, such testing or modification is the sole responsibility of the customer and Dialog Semiconductor excludes all liability in this respect.

Nothing in this document may be construed as a license for customer to use the Dialog Semiconductor products, software and applications referred to in this document. Such license must be separately sought by customer with Dialog Semiconductor.

All use of Dialog Semiconductor products, software and applications referred to in this document is subject to Dialog Semiconductor's Standard Terms and Conditions of Sale, available on the company website (www.dialog-semiconductor.com) unless otherwise stated.

Dialog, Dialog Semiconductor and the Dialog logo are trademarks of Dialog Semiconductor Plc or its subsidiaries. All other product or service names and marks are the property of their respective owners.
