## Pmod8LD ${ }^{\text {TM }}$ Reference Manual

Revised April 15, 2016
This manual applies to the Pmod8LD rev. B

## Overview

The Digilent Pmod8LD has eight high-bright LEDs that are driven by logic-level transistors so that each LED can be individually illuminated from a logic high signal.

Features include:

- Eight high brightness green LEDs
- BJTs for low-power logic level control
- $\quad$ Small PCB size for flexible designs 1.1 in $\times 0.8$ in ( $2.8 \mathrm{~cm} \times 2.0$ cm)
- 2×6-pin Pmod port with GPIO interface

The Pmod8LD.

## 1 Functional Description

The Pmod8LD utilizes individual transistors so that each LED can be turned on or off independently. In order to active an LED, the associated pin on the pin header must receive about 1 mA of current.

## 2 Interfacing with the Pmod

The Pmod8LD communicates with the host board via GPIO pins. Correspondingly, to turn a particular LED on, the pin must be driven to a logic high state and driven to a logic low state to turn a LED off. With the parallel arrangement of these LEDs it is possible to turn on (or off) multiple LEDs simultaneously.

A pin description and diagram are provided below.

|  |  | Header J1 |

## 3 Physical Dimensions

The pins on the pin header are spaced 100 mil apart. The PCB is 1.1 inches long on the sides parallel to the pins on the pin header and 0.8 inches long on the sides perpendicular to the pin header.
