High-Speed USB2.0 1:2 Multiplexer/DeMultiplexer Switch with Signal Enable

## Features

$\rightarrow \mathrm{V}_{\mathrm{DD}}$ Operation at 2.5 V and 3.3 V
$\rightarrow \mathrm{V}_{\mathrm{I} / \mathrm{O}}$ Accepts Signals up to 5.5 V
$\rightarrow$ 1.8-V Compatible Control-Pin Inputs
$\rightarrow$ Low-Power Mode When $\overline{\mathrm{OE}}$ Is Disabled $(2 \mu \mathrm{~A})$
$\rightarrow$ ron $=6 \Omega$ Maximum
$\rightarrow \Delta \mathrm{r}_{\mathrm{ON}}=0.2 \Omega$ Typical
$\rightarrow \mathrm{Cio}(\mathrm{on})=4 \mathrm{pF}$ Typical
$\rightarrow$ Support Over Voltage Protection
$\rightarrow$ Low Power Consumption ( $50 \mu$ A Maximum)
$\rightarrow$ ESD Performance

- IO Pins
- 12KV HBM
- 1KV CDM
- VDD, GND, S, $\overline{\mathrm{OE}}$ Pins
- 4KV HBM
- 1KV CDM
$\rightarrow$ High Bandwidth (1.6 GHz Typical)
$\rightarrow$ Totally Lead-Free \& Fully RoHS Compliant (Notes $1 \& 2$ )
$\rightarrow$ Halogen and Antimony Free. "Green" Device (Note 3)
$\rightarrow$ Packaging (Pb-free \& Green):
- 10-contact, UDFN (ZW10)
- 10-contact, UQFN (ZUA10)

## Block Diagram

## Description

The PI3USB221A is a high-bandwidth switch specially designed for the switching of high-speed USB 2.0 signals in handset and consumer applications, such as cell phones, digital cameras, and notebooks with hubs or controllers with limited USB I/ Os. The wide bandwidth ( 1.1 GHz ) of this switch allows signals to pass with minimum edge and phase distortion. The device multiplexes differential outputs from a USB host device to one of two corresponding outputs. The switch is bidirectional and offers little or no attenuation of the high-speed signals at the outputs. It is designed for low bit-to-bit skew and high channel-to-channel noise isolation, and is compatible with various standards, such as high-speed USB 2.0 ( 480 Mbps ).

The PI3USB221A offer over voltage protection for the D+/D- pins as per the USB 2.0 specification. with the chip power on or off if $\mathrm{D}+/ \mathrm{D}$ - pins are shorted to VBus ( $5 \mathrm{~V}+/-5 \%$ ), a less than 3.8 V (typical) signal will transmit through $1 \mathrm{D}+/ 1 \mathrm{D}-$ and $2 \mathrm{D}+/ 2 \mathrm{D}-$ output.

## Applications

$\rightarrow$ Routes Signals for USB 1.0, 1.1, and 2.0

Notes:

1. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. All voltages are with respect to ground, unless otherwise specified.
3. The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
4. VI and VO are used to denote specific conditions for VI/O.
5. II and IO are used to denote specific conditions for II/O.
6. The package thermal impedance is calculated in accordance with JESD 51-7.

## Notes:

1. $\mathrm{V}_{\text {IN }}$ and $\mathrm{I}_{\text {IN }}$ refer to control inputs. VI, VO, II, and IO refer to data pins.
2. All typical values are at $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}$ (unless otherwise noted), $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.
3. For $\mathrm{I} / \mathrm{O}$ ports, the parameter IOZ includes the input leakage current.
4. This is the increase in supply current for each input that is at the specified TTL voltage level, rather than VDD or GND.
5. Measured by the voltage drop between the input and output terminals at the indicated current through the switch. ON-state resistance is determined by the lower of the voltages of the two terminals.
6. Dron is delta Ron between channels

## Notes:

1. For Max or Min conditions, use the appropriate value specified under Electrical Characteristics for the applicable device type.
2. Specified by design
3. The switch contributes no propagational delay other than the RC delay of the on resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for $10-\mathrm{pF}$ load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interactions with the load on the driven side

## LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:
A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.
B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the
failure of the life support device or to affect its safety or effectiveness.
Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
