## Description

Pericom Semiconductor's PI3VT series of logic circuits are produced using the Company's advanced submicron CMOS technology, achieving industry leading performance.
The PI3VT32X245-A, a 2.5 V or 3.3 V 16-bit 2-port bus switch, is designed with a low ON resistance ( 5 ohms ). The switches are turned ON or enabled by the Bus Enable ( $\overline{\mathrm{BE}}$ ) input signals.
Given a 3.3 V supply and an input voltage of 3.3 V , the switch translates to an output voltage of 2.5 V . Similarly, when operated with a 2.5 V supply and given 2.5 V inputs, the device translates the outputs to 1.8 V .

Notes:

1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The bus switch contributes no propagational delay other than the RC delay of the On-Resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for 50 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
