

July 2020 Revision 4

A Product Line of Diodes Incorporated

1545 Barber Lane Milpitas, CA 95035 Telephone: 408-232-9100 FAX: 408-434-1040 Internet: <u>http://www.diodes.com</u>

A Product Line of Diodes Incorporated

#### **IMPORTANT NOTICE**

DIODES INCORPORATED MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARDS TO THIS DOCUMENT, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION).

Diodes Incorporated and its subsidiaries reserve the right to make modifications, enhancements, improvements, corrections or other changes without further notice to this document and any product described herein. Diodes Incorporated does not assume any liability arising out of the application or use of this document or any product described herein; neither does Diodes Incorporated convey any license under its patent or trademark rights, nor the rights of others. Any Customer or user of this document or products described herein in such applications shall assume all risks of such use and will agree to hold Diodes Incorporated and all the companies whose products are represented on Diodes Incorporated website, harmless against all damages.

Diodes Incorporated does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel.

Should Customers purchase or use Diodes Incorporated products for any unintended or unauthorized application, Customers shall indemnify and hold Diodes Incorporated and its representatives harmless against all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized application.

Products described herein may be covered by one or more United States, international or foreign patents pending. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks.

This document is written in English but may be translated into multiple languages for reference. Only the English version of this document is the final and determinative format released by Diodes Incorporated.

#### LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or

2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the

failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devicesor systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.

DATE	<b>REVISION #</b>	DESCRIPTION		
09/27/2008	0.2	Preliminary release of PI7C9X112SL datasheet		
04/28/2009	0.3	Revised General Features and Part Ordering Info		
09/10/2009	1.0	Production release of PI7C9X112SL datasheet		
11/10/2009	1.1	Updated Section 2.2 PCI Express Signal Section		
02/09/2010	1.2	Removed reverse mode related description		
04/21/2016	1.3	Updated Section 2.5 JTAG Boundary Scan Signals		
01/25/2017	1.4	Updated Logo Added Table 14-4 PCI Express Interface - Differential Transmitter (TX) Output Characteristics Added Table 14-5 PCI Express Interface - Differential Receiver (RX) Input Characteristics Added Section 14.4 Operating Ambient Temperature Updated Section 2.8 Pin Assignments Updated Section 14.1 Absolute Maximum Ratings Updated Section 14.2 DC Specifications		
09/27/2017	2	Added Section 14 Power Sequencing Updated Section 17 Ordering Information Revision numbering system changed to whole number		
04/21/2020	3	Updated Section 14 Power Sequencing Updated Figure 16-1 Package Outline Drawing Added Section 14.2 Power-Off Sequence Added Figure 16-2 Part Marking		
07/03/2020	4	5.3.87 XPIP Configuration Register 2 – OFFSET D4h		

## **REVISION HISTORY**

## PREFACE

The datasheet of PI7C9X112SL will be enhanced periodically when updated information is available. The technical information in this datasheet is subject to change without notice. This document describes the functionalities of PI7C9X112SL (PCI Express Bridge) and provides technical information for designers to design their hardware using PI7C9X112SL.

# 1 INTRODUCTION

PI7C9X112SL is a PCIe-to-PCI bridge. PI7C9X112SL is compliant with the *PCI Express Base Specification*, Revision 1.1, the *PCI Express Card Electromechanical Specification*, Revision 1.1, the *PCI Local Bus Specification*, Revision 3.0 and *PCI Express to PCI Bridge Specification*, Revision 1.0. PI7C9X112SL supports forward transparent mode operation. PI7C9X112SL has an x1 PCI Express upstream port and a 32-bit PCI downstream port. The 32-bit PCI downstream port is 66MHz capable (see figure 1-1). PI7C9X112SL configuration registers are backward compatible with existing PCI bridge software and firmware. No modification of PCI bridge software and firmware is needed for the original operation.

#### Figure 1-1 PI7C9X112SL Topology

## 1.1 PCI EXPRESS FEATURES

- Compliant with PCI Express Base Specification, Revision 1.1
- Compliant with PCI Express Card Electromechanical Specification, Revision 1.1
- Compliant with PCI Express to PCI/PCI-X Bridge Specification, Revision 1.0
- Physical Layer interface (x1 link with 2.5Gb/s data rate)
- Lane polarity toggle
- Virtual Isochronous support (upstream TC1-7 generation, downstream TC1-7 mapping)
- ASPM support
- Beacon support
- CRC (16-bit), LCRC (32-bit)
- ECRC and advanced error reporting
- PRBS (Pseudo Random Bit Sequencing) generator/checker for chip testing
- Maximum payload size to 512 bytes

A Product Line of Diodes Incorporated

## 1.2 PCI FEATURES

- Compliant with PCI Local Bus Specification, Revision 3.0
- Compliant with PCI-to-PCI Bridge Architecture Specification, Revision 1.2
- Compliant with PCI Bus PM Interface Specification, Revision 1.1
- Compliant with PCI Hot-Plug Specification, Revision 1.1
- Compliant with PCI Mobile Design Guide, Version 1.1
- 3.3V PCI signaling with 5V I/O tolerance
- Provides two level arbitration support for eight PCI Bus masters using external 4-to-8 de-mux circuit (ie: 74LVC138A).
- 16-bit address decode for VGA
- Subsystem Vendor and Subsystem Device IDs support
- PCI INT interrupt or MSI Function support

## 1.3 GENERAL FEATURES

- Compliant with Advanced Configuration and Power Interface Specification (ACPI), Revision 2.0b
- Compliant with System Management (SM) Bus, Version 2.0
- Forward bridging (PCI Express as primary bus, PCI as secondary bus)
- Transparent mode support
- GPIO support (4 bi-directional pins)
- Power Management (including ACPI, CLKRUN\_L, CLKREQ\_L, PCI\_PM)
- EEPROM (I2C) Interface
- SM Bus Interface
- Auxiliary powers (VAUX, VDDAUX, VDDCAUX) support
- Power consumption less than 0.45 Watt in typical condition
- Industrial temperature range (-40C to 85C)
- Totally Lead-Free & Fully RoHS Compliant (Notes 1 & 2)
- Halogen and Antimony Free. "Green" Device (Note 3)
- For automotive applications requiring specific change control (i.e. parts qualified to AEC-Q100/101/200, PPAP capable, and manufactured in IATF 16949 certified facilities), please <u>contact us</u> or your local Diodes representative.

https://www.diodes.com/quality/product-definitions/

Notes:

<sup>1.</sup> No purposely added lead. Fully EU Directive 2002/95/EC (RoHS), 2011/65/EU (RoHS 2) & 2015/863/EU (RoHS 3) compliant.

<sup>2.</sup> See https://www.diodes.com/quality/lead-free/ for more information about Diodes Incorporated's definitions of Halogen- and Antimony-free, "Green" and Lead-free. 3. Halogen- and Antimony-free "Green" products are defined as those which contain <900ppm bromine, <900ppm chlorine (<1500ppm total Br + Cl) and <1000ppm antimony compounds.

## 2 PIN DEFINITIONS

## 2.1 SIGNAL TYPES

TYPE (	OF SIGNAL - DESCRIPTIONS
В	Bi-directional
I	Input
IU	Input with pull-up
ID	Input with pull-down
IOD	Bi-directional with open drain output
OD	Open drain output
0	Output
Р	Power
G	Ground

## 2.2 PCI EXPRESS SIGNALS

NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION
REFCLKP	7	Ι	Reference Clock Inputs: Connect to external 100MHz differential clock. These
REFCLKN	9		signals require AC coupled with 0.1uF capacitors.
RP	17	Ι	PCI Express data inputs: Differential data receiver input signals
RN	18		
TP	14	0	PCI Express data outputs: Differential data transmitter output signals
TN	13		
PERST_L	36	Ι	PCI Express Fundamental Reset: PI7C9X112SL uses this reset to initialize the
			internal state machines.

## 2.3 PCI SIGNALS

NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION
AD [31:0]	125, 123, 124, 121, 120, 119, 118, 116, 114, 113, 110, 109, 108, 107, 105, 104, 89, 87, 86, 85, 84, 83, 82, 80, 77, 76, 74, 73, 72, 71, 69, 68	В	Address / Data: Multiplexed address and data bus. Address phase is aligned with first clock of FRAME_L assertion. Data phase is aligned with IRDY_L or TRDY_L assertion. Data is transferred on rising edges of CLKOUT[0] when both IRDY_L and TRDY_L are asserted. During bus idle (both FRAME_L and IRDY_L are de-asserted), PI7C9X112SL drives AD to a valid logic level when arbiter is parked to PI7C9X112SL on PCI bus.
CBE_L[3:0]	115, 102, 90, 79	В	<b>Command / Byte Enables (Active LOW):</b> Multiplexed command at address phase and byte enable at data phase. During address phase, the initiator drives commands on CBE [3:0] signals to start the transaction. If the command is a write transaction, the initiator will drive the byte enables during data phase. Otherwise, the target will drive the byte enables during data phase. During bus idle, PI7C9X112SL drives CBE [3:0] signals to a valid logic level when arbiter is parked to PI7C9X112SL on PCI bus.
PAR	93	В	<b>Parity Bit:</b> Parity bit is an even parity (i.e. even number of 1's), which generates based on the values of AD [31:0], CBE [3:0]. If PI7C9X112SL is an initiator with a write transaction, PI7C9X112SL will tri-state PAR. If PI7C9X112SL is a target and a write transaction, PI7C9X112SL will drive PAR one clock after the address or data phase. If PI7C9X112SL is a target and a read transaction, PI7C9X112SL will drive PAR one clock after the address. PAR is tri-stated one cycle after the AD lines are tri-stated. During bus idle, PI7C9X112SL drives PAR to a valid logic level when arbiter is parked to PI7C9X112SL on PCI bus.
FRAME_L	66	В	<b>FRAME</b> (Active LOW): Driven by the initiator of a transaction to indicate the beginning and duration an access. The de-assertion of FRAME_L indicates the final data phase signaled by the initiator in burst transfers. Before being tri-stated, it is driven to a de-asserted state for one cycle.
IRDY_L	99	В	<b>IRDY (Active LOW):</b> Driven by the initiator of a transaction to indicate its ability to complete current data phase on the primary side. Once asserted in a data phase, it is not de-asserted until the end of the data phase. Before tri-stated, it is driven to a de-asserted state for one cycle.
TRDY_L	100	В	<b>TRDY</b> (Active LOW): Driven by the target of a transaction to indicate its ability to complete current data phase on the primary side. Once asserted in a data phase, it is not de-asserted until the end of the data phase. Before tri-stated, it is driven to a de-

DEVSEL_L         98         B         Device Select (Active LOW): Asserted by the target indicating that the device is accepting the transaction. As a master, PTC9X112SL wails for the assertion of this signal within 5 cycles of RAME, Lassertion; otherVIX112L wails for the asserted of the indiator to stop the current transaction. Before tri-stated, it is driven to a de-asserted state for one cycle.           STOP_L         95         B         STOP (Active LOW): Asserted by the initiator for multiple transaction.           LOCK_L         96         B         LOCK (Active LOW): Asserted by the initiator for multiple transaction.           IDSEL         64         1         Initialization Device Select: Used as a chip select line for Type 0 configuration access to tridge's configuration space.           PERR_L         92         B         Parity Error (Active LOW): Asserted when a data parity error is detected for data received on the PTC basit Interface. Before being ti-stated, it is driven to a de-asserted state for one cycle.           SERR_L         92         B         Parity Error (Active LOW): Asserted when adata parity error is detected for data received on the PTC basit Interface. Before being ti-stated, it is driven to a de-asserted state for one cycle.           SERR_L         63         IOD         System error.         IS ERR control is enabled, PTC9X112SL will assert SERR_L           • Address parity error         • Posted write transaction         • Target abort during posted write transaction           • Posted write data parity error on target bas	NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION
signal within 5 cycles of PRAME_L assertion; otherwise, terminate with master abort. Before tri-stated, it is driven to a de-asserted state for one cycle.           STOP_L         95         B         STOP (Active LOW): Asserted by the attraget indicating that the target is requesting the initiator to stop the current transaction. Before tri-stated, it is driven to a de- asserted state for one cycle.           LOCK, L         96         B         LOCK (Active LOW): Asserted by the initiator for multiple transactions to complete. PICOX1128L does not support any upstream LOCK transaction.           IDSEL         64         1         Initialization Device Select: Used as a clup select line for Type 0 configuration access to bridge's configuration space.           PERR_L         92         B         Parity Error (Active LOW): Asserted when a data parity error is detected for data received on the PC1 bus interface. Before being tri-stated, it is driven to a de-asserted state for one cycle.           SERR_L         63         IOD         System Error (Active LOW): Can be driven 1.0W by any device to indicate a system error. If SERR hourd by the instaction 1.0W and be appressing the system error.           Ferry Edu vitic data parity error on target bus - Address parity error         - Posted write transaction discarded           - Delayed transaction master timeout         - Errors reported from PCI Express port (advanced error reporting) in transparent mode.           This signal is an open drain buffer that requires an external pull-up resistor for proper operation.         - Request discarded - Delayed transaction one the PCD bu				asserted state for one cycle.
abort.         Before tri-stated, it is driven to a de-asserted state for one cycle.           STOP_L         95         B         STOP (Active LOW): Asserted by the target indicating that the target is requesting the initiator to stop the current transaction. Before tri-stated, it is driven to a de-asserted state for one cycle.           LOCK_L         96         B         LOCK (Active LOW): Asserted by the initiator for multiple transactions to complete. PI/C9X112SL does not support any upstrean LOCK transaction.           IDSEL         64         1         Initialization Device Select: Used as chip select line for Type 0 configuration access to bridge's configuration space.           PERR_L         92         B         Parity Error (Active LOW): Can be driven LOW by any device to indicate a strete or one cycle.           SERR_L         63         IOD         System Error (Active LOW): Can be driven LOW by any device to indicate a system orr. If SERR control is enabled, PI7C9X112SL will assert SERR_L.           • Address parity error         • Address parity error is called and parity error an carget bus           • Master abort during posted write transaction         • Target abort during posted write transaction           • Delayed write request discarded         • Delayed write request discarded           • Delayed transaction master timeout         • Target abort during posted write transaction           • Target abort during posted write transaction         • Target abort during posted eassert ReD_LS for at least 2 PCI clock cotyputs: Secle	DEVSEL_L	98	В	accepting the transaction. As a master, PI7C9X112SL waits for the assertion of this
STOP_L       95       B       STOP (Active LOW): Asserted by the target indicating that the target is requesting the initiator to soft the current transaction. Before tri-stated, it is driven to a deserted state for one cycle.         LOCK_L       96       B       LOCK (Active LOW): Asserted by the initiator for multiple transaction.         IDSEL       64       1       Initialization Device Select: Used as a chip select line for Type 0 configuration access to bridge's configuration space.         PERR_L       92       B       Parity Error (Active LOW): Asserted when a data parity error is detected for data received on the PCI bus interface. Before being tri-stated, it is driven to a de-asserted state for one cycle.         SERR_L       63       IOD       System Error. (Active LOW): Can be driven LOW by any device to indicate a system error. If SERR control is enabled, PI7C9X112SL will assert SERR_L.         • Address parity error       • Posted write data parity error on target bus       • Master abort during posted write transaction         • Target abort during posted write transaction       • Target abort during posted write transaction       • Posted write transaction         • Errors reported from PCI Express port (advanced error reporting) in transparent mode.       • Delayed real request discarded         • Delayed real request discarded       • Delayed transaction master timeout       • Errors reported from PCI Express port (advanced error reporting) in transparent mode.         REQ_L [3:0]       40, 38, 37, 35       1				
Initiator to stop the current transaction. Before tri-stated, it is driven to a de- asserted state for one cycle.           LOCK_L         96         B         LOCK (Active LOW): Asserted by the initiator for multiple transactions to complete PTC/SN1128. does not support any upstream LOCK transaction.           IDSEL         64         I         Initialization Device Select: Used as a chip select line for Type 0 configuration access to bridge's configuration space.           PERR_L         92         B         Parity Error (Active LOW): Asserted when a data parity error is detected for data received on the PCI bus interface. Before being tri-stated, it is driven to a de-asserted state for one cycle.           SERR_L         63         IOD         System Error (Active LOW): Can be driven LOW by any device to indicate a system error. If SER control is enabled, PTC/SN112SL will assert SERR_L.           • Address parity error         • Address parity error         • Address parity error           • Posted write data parity error on target bus         • Master abort during posted write transaction           • Traget abort during posted write transaction         • Delayed transaction master timeout           • Delayed transaction master timeout         • Delayed transaction master timeout           • Delayed transaction master timeout         • Delayed transaction master devices de-assert ReQ_Ls for at least 2 PCI clock cycles before asserting them again. ## 2.4 MODE SELECT AND STRAPPING SIGNALS

NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION
TM0	127	Ι	Mode Select 0: Mode Selection Pin to select EEPROM or SM Bus. TM0=0 for
			EEPROM (I2C) support and TM0=1 for SM Bus support. TM0 is also a strapping
			pin. See table 3-1 mode selection and 3-2 for strapping control.
TM1	26	Ι	Mode Select 1: Mode Selection Pin for normal operation. Set TM1=0 for normal
			operation. TM1=1 is reserved.
MSK_IN	126	Ι	Hot Plug Enable input.
RESERVED 0	31	Ι	<b>Reserved 0:</b> This pin should be tied low for normal operation.

## 2.5 JTAG BOUNDARY SCAN SIGNALS

NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION		
TCK	28	IU	Test Clock: TCK is the test clock to synchronize the state information and data on		
			the PCI bus side of PI7C9X112SL during boundary scan operation. At normal		
			operation mode, this pin should be left open(NC).		
TMS	27	IU	Test Mode Select: TMS controls the state of the Test Access Port (TAP) controller.		
			At normal operation mode, this pin should be pulled low through a 1K-Ohm pull-		
			down resistor.		
TDO	32	0	Test Data Output: TDO is the test data output and connects to the end of the JTAG		
			scan chain. At normal operation mode, this pin should be left open(NC).		
TDI	29	IU	Test Data Input: TDI is the test data input and connects to the beginning of the		
			JTAG scan chain. It allows the test instructions and data to be serially shifted into the		
			PCI side of PI7C9X112SL. At normal operation mode, this pin should be left		
			open(NC).		
TRST_L	30	IU	Test Reset (Active LOW): TRST_L is the test reset to initialize the Test Access Port		
			(TAP) controller. At normal operation mode, this pin should be pulled low through a		
			1K-Ohm pull-down resistor.		

#### 2.6 MISCELLANEOUS SIGNALS

NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION	
GPIO [3:0]	50, 51, 54, 55	В	General Purpose I/O Data Pins: GPIO[3:0] pins are utilized as REQ_L[7:4]	
			coupled with REQ_L[3:0] to provide arbitration of 8 PCI Master Devices.	
SMBCLK /	3	В	SMBUS / EEPROM Clock Pin: When EEPROM (I2C) interface is selected	
SCL			(TM0=0), this pin is an output of SCL clock and connected to EEPROM clock input.	
			When SMBUS interface is selected (TM0=1), this pin is an input for the clock of	
			SMBUS.	
SMBDATA /	4	B/IOD	SMBUS / EEPROM Data Pin: Data Interface Pin to EERPOM or SMBUS. When	
SDA			EEPROM (I2C) interface is selected (TM0=0), this pin is a bi-directional signal.	
			When SMBUS interface is selected (TM0=1), this pin is an open drain signal.	
PME_L	1	В	Power Management Event Pin: Power Management Event Signal is asserted to	
			request a change in the device or link power state.	

## 2.7 POWER AND GROUND PINS

NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION	
VDDA	8, 20, 21	Р	Analog Voltage Supply for PCI Express Interface: Connect to the 1.0V Power	
			Supply.	
VDDP	11, 23, 24	Р	Digital Voltage Supply for PCI Express Interface: Connect to the 1.0V Power	
			Supply.	
VDDAUX	15	Р	Auxiliary Voltage Supply for PCI Express Interface: Connect to the 1.0V Power	
			Supply.	
VTT	12	Р	Termination Supply Voltage for PCI Express Interface: Connect to the 1.5V	
			Power Supply.	
VDDC	45, 65, 75, 94, 112	Р	Core Supply Voltage: Connect to the 1.0V Power Supply.	
VDDCAUX	5	Р	Auxiliary Core Supply Voltage: Connect to the 1.0V Power Supply.	
VD33	33, 53, 60, 70, 81, 91,	Р	I/O Supply Voltage for PCI Interface: Connect to the 3.3V Power Supply for PCI	
	101, 111, 122		I/O Buffers.	
VAUX	2	Р	Auxiliary I/O Supply Voltage for PCI interface: Connect to the 3.3V Power	
			Supply.	

NAME	PIN ASSIGNMENT	TYPE	DESCRIPTION
VSS	6, 10, 16, 19, 22, 46,	Р	Ground: Connect to Ground.
	34, 57, 67, 78, 88, 97,		
	106, 117, 128, 129

# 3 MODE SELECTION AND PIN STRAPPING

## 3.1 FUNCTIONAL MODE SELECTION

PI7C9X112SL uses TM1 and TM0 pins to select different modes of operations. These two input signals are required to be stable during normal operation. One of the two combinations of normal operation can be selected by setting the logic values using the two mode select pins. For example, if the logic values are low for TM1 and TM0 pins, the normal operation will have EEPROM (I2C) support with internal arbiter. The designated operation with respect to the values of the TM1 and TM0 pins are defined on Table 3-1:

#### Table 3-1 Mode Selection

TM1	TM0	Functional Mode
0	0	EEPROM (I2C) support
0	1	SM Bus support

## 3.2 PIN STRAPPING

If TM1 is strapped to low, PI7C9X112SL uses REQ\_L[3:2] as the strapping pins during PCIe PERST# de-assertion to enable Clock Power Management feature.

#### Table 3-2 Pin Strapping

TM1 Strapped	REQ_L[3:2]	Test Functions	
0	2'b0	Clock Power Management is	
		enabled, only two PCI devices	
		supported.	
		CLKOUT[2] is used as CLKREQ#	
		CLKOUT[3] is used as CLKRUN#	

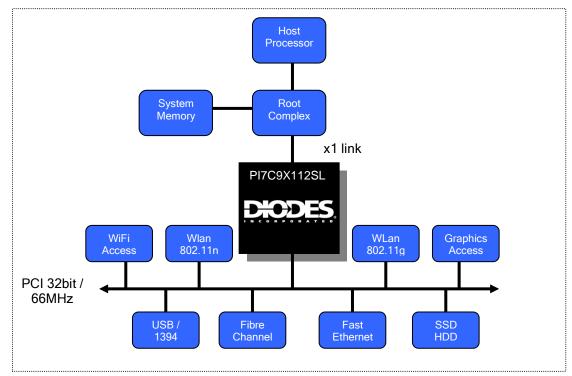

#### 4 FORWARD (PCIe to PCI) BRIDGING

PI7C9X112SL supports forward mode operation. For example, when PI7C9X112SL is operating in forward PCIe Bridge, its PCI Express interface is connected to a root complex and its PCI bus interface is connected to PCI Master devices.

PCI based systems and peripherals are ubiquitous in the I/O interconnect technology market today. It will be a tremendous effort to convert existing PCI based products to PCI Express systems. PI7C9X112SL provides the drop-in bridging solution to interface legacy PCI I/O Devices to PCI Express Root Complex.

### **Figure 4-1 Forward Bridging**

#### 4.1**TLP STRUCTURE**

PCI Express TLP (Transaction Layer Packet) Structure is comprised of format, type, traffic class, attributes, TLP digest, TLP poison, and length of data payload.

There are four TLP formats defined in PI7C9X112SL based on the states of FMT [1] and FMT [0] as shown on Table 4-1.

FMT [1]	FMT [0]	TLP Format
0	0	3 double word, without data
0	1	4 double word, without data
1	0	3 double word, with data

#### Table 4-1 TLP Format

Data payload of PI7C9X112SL can range from 4 (1DW) to 256 (64DW) bytes. PI7C9X112SL supports three TLP routing mechanisms. They are comprised of Address, ID, and Implicit routings. Address routing is being used for Memory and IO

4 double word, with data

requests. ID based (bus, device, function numbers) routing is being used for configuration requests. Implicit routing is being used for message routing. There are two message groups (baseline and advanced switching). The baseline message group contains INTx interrupt signaling, power management, error signaling, locked transaction support, slot power limit support, vendor defined messages, hot-plug signaling. The other is advanced switching support message group. The advanced switching support message contains data packet and signal packet messages. Advanced switching is beyond the scope of PI7C9X112SL implementation.

The r [2:0] values of the "type" field will determine the destination of the message to be routed. All baseline messages must use the default traffic class zero (TC0).

## 4.2 VIRTUAL ISOCHRONOUS OPERATION

This section provides a summary of Virtual Isochronous Operation supported by PI7C9X112SL. Virtual Isochronous support is disabled by default. Virtual Isochronous feature can be turned on with setting bit [26] of offset 40h to one. Control bits are designated for selecting which traffic class (TC1-7) to be used for upstream (PCI Express-to-PCI). PI7C9X112SL accepts only TC0 packets of configuration, IO, and message packets for downstream (PCI Express-to-PCI). If configuration, IO and message packets have traffic class other than TC0, PI7C9X112SL will treat them as malformed packets. PI7C9X112SL maps all downstream memory packets from PCI Express to PCI transactions regardless the virtual Isochronous operation is enabled or not.

# 5 CONFIGURATION REGISTER ACCESS

PI7C9X112SL supports Type-0 and Type-1 configuration space headers and Capability ID of 01h (PCI power management) to 10h (PCI Express capability structure).

With pin REVRSB = 0, device-port type (bit [7:4]) of capability register will be set to 7h (PCI Express-to-PCI). When pin REVRSB = 1, device-port type (bit [7:4]) of capability register will be set to 8h (PCI-to-PCI Express bridge).

PI7C9X112SL supports PCI Express capabilities register structure with capability version set to 1h (bit [3:0] of offset 02h).

## 5.1 CONFIGURATION REGISTER MAP

PI7C9X112SL supports capability pointer with PCI power management (ID=01h), PCI bridge sub-system vendor ID (ID=0Dh), PCI Express (ID=10h), vital product data (ID=03h), and message signaled interrupt (ID=05h). Slot identification (ID=04h) is off by default and can be turned on through configuration programming.

Primary Bus Configuration Access or Secondary Bus Configuration Access	PCI Configuration Register Name (type1)	EEPROM (I2C) Access	SM Bus Access
01h - 00h	Vendor ID	Yes1	Yes2
03h-02h	Device ID	Yes1	Yes2
05h-04h	Command Register	Yes	Yes
07h - 06h	Primary Status	Yes	Yes

F3h – F0h	MSI Capability Register	Yes	Yes
F7h – F4h	Message Address	Yes	Yes
FBh – F8h	Message Upper Address	Yes	Yes
FFh – FCh	Message Date	Yes	Yes

*Note 1: When masquerade is enabled, it is pre-loadable.* 

Note 2: The VPD data is read/write through 12C during VPD operation. Note 3: Read access only.

## 5.2 PCI EXPRESS EXTENDED CAPABILITY REGISTER MAP

PI7C9X112SL also supports PCI Express Extended Capabilities with from 257-byte to 4096-byte space. The offset range is from 100h to FFFh. The offset 100h is defined for Advance Error Reporting (ID=0001h). The offset 150h is defined for Virtual Channel (ID=0002h).

Primary Bus Configuration Access or Secondary Bus Configuration Access	Transparent Mode (type1)	EEPROM (I2C) Access	SM Bus Access
103h - 100h	Advanced Error Reporting (AER) Capability	Yes	Yes2
107h - 104h	Uncorrectable Error Status	No	Yes
10Bh - 108h	Uncorrectable Error	Yes	Yes

Table 5-2 PCI Express Extended Capability Register Map (100h – FFFh)

Primary Bus	Transparent Mode	EEPROM	SM Bus	
<b>Configuration Access or</b>	(type1)	(I2C)	Access	
Secondary Bus		Access		
Configuration Access				
	Mask			
10Fh - 10Ch	Uncorrectable Severity	No	Yes

Note 5: Read access only.

## 5.3 PCI CONFIGURATION REGISTERS

The following section describes the configuration space when the device is in transparent mode. The descriptions for different register type are listed as follow:

Register Type	Descriptions
RO	Read Only
ROS	Read Only and Sticky
RW	Read/Write
RWC	Read/Write "1" to clear
RWS	Read/Write and Sticky
RWCS	Read/Write "1" to clear and Sticky

#### 5.3.1 VENDOR ID – OFFSET 00h

BIT	FUNCTION	TYPE	DESCRIPTION
15:0	Vendor ID	RO	Identifies Pericom as the vendor of this device. Returns 12D8h when read.

#### 5.3.2 DEVICE ID – OFFSET 00h

BIT	FUNCTION	TYPE	DESCRIPTION
31:16	Device ID	RO	Identifies this device as the PI7C9X112SL. Returns E112 when read.

#### 5.3.3 COMMAND REGISTER – OFFSET 04h

BIT	FUNCTION	TYPE	DESCRIPTION
0	I/O Space Enable	RW	0: Ignore I/O transactions on the primary interface
			1: Enable response to memory transactions on the primary interface
			Reset to 0
1	Memory Space Enable	RW	0: Ignore memory read transactions on the primary interface
			1: Enable memory read transactions on the primary interface
2	Bus Master Enable	RW	Reset to 0 0: Do not initiate memory or I/O transactions on the primary interface and
Z	Bus Master Enable	KW	disable response to memory and I/O transactions on the secondary interface and
			1: Enable the bridge to operate as a master on the primary interfaces for
			memory and I/O transactions forwarded from the secondary interface.
			Reset to 0
3	Special Cycle Enable	RO	0: PI7C9X112SL does not respond as a target to Special Cycle transactions,
			so this bit is defined as Read-Only and must return 0 when read
			Reset to 0
4	Memory Write and	RO	0: PI7C9X112SL does not originate a Memory Write and Invalidate
Invalidate Enable		transaction. Implements this bit as Read-Only and returns 0 when read	
		(unless forwarding a transaction for another master).	
			Reset to 0
5	VGA Palette Snoop Enable	RO /	This bit is not supported by PI7C9X112SL.
		RW	Reset to 0
6	Parity Error Response	RW	0: May ignore any parity error that is detected and take its normal action
0	Enable	IX W	1: This bit if set, enables the setting of Master Data Parity Error bit in the
	Lindole		Status Register when poisoned TLP received or parity error is detected and takes its normal action
			Reset to 0
7	Wait Cycle Control	RO	Wait cycle control not supported
			Reset to 0
8	SERR_L Enable Bit	RW	0: Disable
			1: Enable PI7C9X112SL to report non-fatal or fatal error message to the
			Root Complex.
			Reset to 0
9	Fast Back-to-Back Enable	RO	Fast back-to-back enable not supported
			Reset to 0
10	Interrupt Disable	RW	This bit is not supported by PI7C9X112SL.
			Reset to 0
15:11	Reserved	RO	Reset to 00000

## 5.3.4 PRIMARY STATUS REGISTER - OFFSET 04h

BIT	FUNCTION	TYPE	DESCRIPTION
18:16	Reserved	RO	Reset to 000
19	Reserved	RO	Reset to 0
20	Capability List Capable	RO	1: PI7C9X112SL supports the capability list (offset 34h in the pointer to the data structure)
			Reset to 1
21	66MHz Capable	RO	This bit is not supported by PI7C9X112SL.
			Reset to 0
22	Reserved	RO	Reset to 0
23	Fast Back-to-Back Capable	RO	This bit is not supported by PI7C9X112SL.
			Reset to 0
24	Master Data Parity Error Detected	RWC	<ul> <li>Bit set if its Parity Error Enable bit is set and either of the conditions occurs on the primary:</li> <li>Receives a completion marked poisoned</li> <li>Poisons a write request</li> </ul>
			Reset to 0
26:25	DEVSEL_L Timing (medium decode)	RO	These bits are not supported by PI7C9X112SL. Reset to 00
27	Signaled Target Abort	RWC	This bit is set when PI7C9X112SL completes a request using completer abort status on the primary
			Reset to 0
28	Received Target Abort	RWC	This bit is set when PI7C9X112SL receives a completion with completer abort completion status on the primary
			Reset to 0
29	Received Master Abort	RWC	This bit is set when PI7C9X112SL receives a completion with unsupported request completion status on the primary
30	Signaled System Error	RWC	This bit is set when PI7C9X112SL sends an ERR_FATAL or ERR_NON_FATAL message on the primary
			Reset to 0
31	Detected Parity Error	RWC	This bit is set when poisoned TLP is detected on the primary
			Reset to 0

#### 5.3.5 REVISION ID REGISTER - OFFSET 08h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Revision	RO	Reset to 0000000h

### 5.3.6 CLASS CODE REGISTER - OFFSET 08h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Programming Interface	RO	Subtractive decoding of PCI-PCI bridge not supported
			Reset to 00000000
23:16	Sub-Class Code	RO	Sub-Class Code
			00000100: PCI-to-PCI bridge
			Reset to 00000100
31:24	Base Class Code	RO	Base class code
			00000110: Bridge Device
			Reset to 00000110

#### 5.3.7 CACHE LINE SIZE REGISTER – OFFSET 0Ch

BIT	FUNCTION	TYPE	DESCRIPTION	
1:0	Reserved	RO	Bit [1:0] not supported	
			Reset to 00	
2	Cache Line Size	RW	1: Cache line size = 4 double words	
			Reset to 0	
3	Cache Line Size	RW	1: Cache line size = 8 double words	
			Reset to 0	
4	Cache Line Size	RW	1: Cache line size = 16 double words	
			Reset to 0	
5	Cache Line Size	RW	1: Cache line size = 32 double words	
			Reset to 0	
7:6	Reserved	RO	Bit [7:6] not supported	
			Reset to 00	

#### 5.3.8 PRIMARY LATENCY TIMER REGISTER – OFFSET 0Ch

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Primary Latency Timer	RO	8 bits of primary latency timer in PCI bus
			Reset to 00h

#### 5.3.9 PRIMARY HEADER TYPE REGISTER – OFFSET 0Ch

BIT	FUNCTION	TYPE	DESCRIPTION
22:16	PCI-to-PCI bridge	RO	PCI-to-PCI bridge configuration $(10 - 3Fh)$
	configuration		Reset to 0000001
		DO	
		RO	
23	Single Function Device	RO	0: Indicates single function device
			Reset to 0
31:24	Reserved	RO	Reset to 00h

#### 5.3.10 RESERVED REGISTERS – OFFSET 10h TO 17h

#### 5.3.11 PRIMARY BUS NUMBER REGISTER - OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Primary Bus Number	RW	Reset to 00h

#### 5.3.12 SECONDARY BUS NUMBER REGISTER – OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Secondary Bus Number	RW	Reset to 00h

### 5.3.13 SUBORDINATE BUS NUMBER REGISTER – OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION
23:16	Subordinate Bus Number	RW	Reset to 00h

### 5.3.14 SECONDARY LATENCY TIME REGISTER - OFFSET 18h

BIT	FUNCTION	TYPE	DESCRIPTION
31:24	Secondary Latency Timer	RW	Secondary latency timer in PCI bus
			Reset to 00h in PCI mode

#### 5.3.15 I/O BASE REGISTER - OFFSET 1Ch

BIT	FUNCTION	TYPE	DESCRIPTION
1:0	32-bit I/O Addressing	RO	01: Indicates PI7C9X112SL supports 32-bit I/O addressing
	Support		
			Reset to 01
3:2	Reserved	RO	Reset to 00
7:4	I/O Base	RW	Indicates the I/O base (0000_0000h)
			Reset to 0000

### 5.3.16 I/O LIMIT REGISTER - OFFSET 1Ch

BIT	FUNCTION	TYPE	DESCRIPTION
9:8	32-bit I/O Addressing	RO	01: Indicates PI7C9X112SL supports 32-bit I/O addressing
	Support		
			Reset to 01
11:10	Reserved	RO	Reset to 00
15:12	I/O Base	RW	Indicates the I/O Limit (0000_0FFFh)
			Reset to 0000

## 5.3.17 SECONDARY STATUS REGISTER - OFFSET 1Ch

BIT	FUNCTION	TYPE	DESCRIPTION
20:16	Reserved	RO	Reset to 00000
21	66MHz Capable	RO	Indicates PI7C9X112SL is 66MHz capable
			Reset to 1
22	Reserved	RO	Reset to 0
23	Fast Back-to-Back Capable	RO	Reset to 1 when secondary bus is in PCI mode (supports fast back-to-back transactions)
24	Master Data Parity Error Detected	RWC	This bit is set if its parity error enable bit is set and either of the conditions occur on the primary:
			<ul> <li>Detected parity error when receiving data or split response for read</li> <li>Observes S_PERR_L asserted when sending data or receiving split response for write</li> <li>Receives a split completion message indicating data parity error occurred for non-posted write</li> </ul>
			Reset to 0
26:25	DEVSEL_L Timing (medium decoding)	RO	01: medium DEVSEL_L decoding
	(incurain decoding)		Reset to 01
27	Signaled Target Abort	RWC	Bit is set when PI7C9X112SL signals target abort
			Reset to 0
28	Received Target Abort	RWC	Bit is set when PI7C9X112SL detects target abort on the secondary interface
			Reset to 0
29	Received Master Abort	RWC	Bit is set when PI7C9X112SL detects master abort on the secondary interface
			Reset to 0

BIT	FUNCTION	TYPE	DESCRIPTION
30	Received System Error	RWC	Bit is set when PI7C9X112SL detects SERR_L assertion on the secondary interface
			Reset to 0
31	Detected Parity Error	RWC	Bit is set when PI7C9X112SL detects address or data parity error
			Reset to 0

### 5.3.18 MEMORY BASE REGISTER - OFFSET 20h

BIT	FUNCTION	TYPE	DESCRIPTION
3:0	Reserved	RO	Reset to 0000
15:4	Memory Base	RW	Memory Base (8000000h)
			Reset to 800h

### 5.3.19 MEMORY LIMIT REGISTER - OFFSET 20h

BIT	FUNCTION	TYPE	DESCRIPTION
19:16	Reserved	RO	Reset to 0000
31:20	Memory Limit	RW	Memory Limit (000FFFFFh)
			Reset to 000h

#### 5.3.20 PREFETCHABLE MEMORY BASE REGISTER - OFFSET 24h

BIT	FUNCTION	TYPE	DESCRIPTION
3:0	64-bit Addressing Support	RO	0001: Indicates PI7C9X112SL supports 64-bit addressing
			Reset to 0001
15:4	Prefetchable Memory Base	RW	Prefetchable Memory Base (00000000_80000000h)
			Reset to 800h

### 5.3.21 PREFETCHABLE MEMORY LIMIT REGISTER - OFFSET 24h

BIT	FUNCTION	TYPE	DESCRIPTION
19:16	64-bit Addressing Support	RO	0001: Indicates PI7C9X112SL supports 64-bit addressing
			Reset to 0001
31:20	Prefetchable Memory Limit	RW	Prefetchable Memory Limit (0000000_000FFFFFh)
	-		
			Reset to 000h

#### 5.3.22 PREFETCHABLE BASE UPPER 32-BIT REGISTER - OFFSET 28h

BIT	FUNCTION	TYPE	DESCRIPTION
31:0	Prefetchable Base Upper 32-	RW	Bit [63:32] of prefetchable base
	bit		
			Reset to 0000000h

## 5.3.23 PREFETCHABLE LIMIT UPPER 32-BIT REGISTER - OFFSET 2Ch

BIT	FUNCTION	TYPE	DESCRIPTION
31:0	Prefetchable Limit Upper	RW	Bit [63:32] of prefetchable limit
	32-bit		
			Reset to 0000000h

#### 5.3.24 I/O BASE UPPER 16-BIT REGISTER - OFFSET 30h

BIT	FUNCTION	TYPE	DESCRIPTION
15:0	I/O Base Upper 16-bit	RW	Bit [31:16] of I/O Base
			Reset to 0000h

#### 5.3.25 I/O LIMIT UPPER 16-BIT REGISTER - OFFSET 30h

BIT	FUNCTION	TYPE	DESCRIPTION
31:16	I/O Limit Upper 16-bit	RW	Bit [31:16] of I/O Limit
			Reset to 0000h

#### 5.3.26 CAPABILITY POINTER - OFFSET 34h

BIT	FUNCTION	TYPE	DESCRIPTION
31:8	Reserved	RO	Reset to 0
7:0	Capability Pointer	RO	Capability pointer to 80h
			Reset to 80h

#### 5.3.27 EXPANSION ROM BASE ADDRESS REGISTER - OFFSET 38h

BIT	FUNCTION	TYPE	DESCRIPTION
31:0	Expansion ROM Base Address	RO	Expansion ROM not supported.
			Reset to 0000000h

#### 5.3.28 INTERRUPT LINE REGISTER - OFFSET 3Ch

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Interrupt Line	RW	
			For initialization code to program to tell which input of the interrupt controller the PI7C9X112SL's INTA_L in connected to.
			Reset to 00000000

### 5.3.29 INTERRUPT PIN REGISTER - OFFSET 3Ch

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Interrupt Pin	RO	
			Designates interrupt pin INTA_L, is used
			Reset to 01h

### 5.3.30 BRIDGE CONTROL REGISTER – OFFSET 3Ch

BIT	FUNCTION	TYPE	DESCRIPTION
16	Parity Error Response Enable	RW	<ul><li>0: Ignore parity errors on the secondary</li><li>1: Enable parity error detection on secondary</li><li>Controls the response to uncorrectable address attribute and data errors on the</li></ul>
			secondary Reset to 0

BIT	FUNCTION	TYPE	DESCRIPTION
17	SERR_L Enable	RW	0: Disable the forwarding of SERR_L to ERR_FATAL and
			ERR_NONFATAL
			1: Enable the forwarding of SERR_L to ERR_FATAL and
			ERR_NONFATAL
			Reset to 0
18	ISA Enable	RW	0: Forward downstream all I/O addresses in the address range defined by the
			I/O Base and Limit registers
			1: Forward upstream all I/O addresses in the address range defined by the
			I/O Base and Limit registers that are in the first 64KB of PCI I/O address
			space (top 768 bytes of each 1KB block)
			Reset to 0
19	VGA Enable	RW	0: Do not forward VGA compatible memory and I/O addresses from the
			primary to secondary, unless they are enabled for forwarding by the defined
			I/O and memory address ranges
			1: Forward VGA compatible memory and I/O addresses from the primary
			and secondary (if the I/O enable and memory enable bits are set), independent of the ISA enable bit
20	VGA 16-bit Decode	RW	0: Execute 10-bit address decodes on VGA I/O accesses
20	V GIT TO DIE DECORE	10.00	1: Execute 16-bit address decode on VGA I/O accesses
			Reset to 0
21	Master Abort Mode	RW	0: Do not report master aborts (return FFFFFFFh on reads and discards
			data on write) 1: Report master abort by signaling target abort if possible or by the
			assertion of SERR_L (if enabled).
			assertion of bERREE (if enabled).
			Reset to 0
22	Secondary Interface Reset	RW	0: Do not force the assertion of RESET_L on secondary PCI bus
			1: Force the assertion of RESET_L on secondary PCI bus
			Reset to 0

## 5.3.31 PCI DATA BUFFERING CONTROL REGISTER - OFFSET 40h

BIT	FUNCTION	TYPE	DESCRIPTION
0	Secondary Internal Arbiter's PARK Function	RW	0: Park to the last master 1: Park to PI7C9X112SL secondary port Reset to 0

BIT	FUNCTION	TYPE	DESCRIPTION
1	Memory Read Prefetching Dynamic Control Disable	RW	0: Enable memory read prefetching dynamic control for PCI to PCIe read 1: Disable memory read prefetching dynamic control for PCI to PCIe read
2	Completion Data Prediction	RW	Reset to 0         0: Enable completion data prediction for PCI to PCIe read.
	Control		1: Disable completion data prediction
3	CFG Type0-to-Type1 conversion Enable	RW	Reset to 0 0: CFG Type0-to-Type1 conversion is disabled. 1: CFG Type0-to-Type1 conversion is enabled if the AD[31:28] is all 1s. bridge will ignore the AD[0] and always treats the cfg transaction as type 1, other AD bit (except AD[31:28], AD[0]) must meet the Type 1 format
5:4	PCI Read Multiple Prefetch	RW	Reset to 0         00: One cache line prefetch if memory read multiple address is in
	Mode		<ul> <li>prefetchable range at the PCI interface</li> <li>01: Full prefetch if address is in prefetchable range at PCI interface, and the PI7C9X112SL will keep remaining data after it disconnects the external master during burst read with read multiple command until the discard timer expires</li> <li>10: Full prefetch if address is in prefetchable range at PCI interface</li> <li>11: Full prefetch if address is in prefetchable range at PCI interface and the PI7C9X112SL will keep remaining data after the read multiple is terminated either by an external master or by the PI7C9X112SL, until the discard time</li> </ul>
7:6	PCI Read Line Prefetch Mode	RW	expires Reset to 10 00: Once cache line prefetch if memory read address is in prefetchable range at PCI interface 01: Full prefetch if address is in prefetchable range at PCI interface and the
			<ul> <li>PI7C9X112SL will keep remaining data after it is disconnected by an external master during burst read with read line command, until discard timer expires</li> <li>10: Full prefetch if memory read line address is in prefetchable range at PCI interface</li> <li>11: Full prefetch if address is in prefetchable range at PCI interface and the PI7C9X112SL will keep remaining data after the read line is terminated either by an external master or by the PI7C9X112SL, until the discard timer expires</li> </ul>
9:8	PCI Read Prefetch Mode	RW	Reset to 00         00: One cache line prefetch if memory read address is in prefetchable range at PCI interface         01: Reserved
			<ul> <li>10: Full prefetch if memory read address is in prefetchable range at PCI interface</li> <li>11: Disconnect on the first DWORD</li> </ul>
10	PCI Special Delayed Read Mode Enable	RW	Reset to 00         0: Retry any master at PCI bus that repeats its transaction with command code changes.         1: Allows any master at PCI bus to change memory command code (MR, MRL, MRM) after it has received a retry. The PI7C9X112SL will complete the memory read transaction and return data back to the master if the address and byte enables are the same.         Reset to 0

BIT	FUNCTION	TYPE	DESCRIPTION
11	Optional Malformed Packet	RW	0: Optional Malformed Packet checking is disabled
	checking Enable		1: Optional Malformed Packet checking is enabled
			Reset to 0
14:12	Maximum Memory Read	RW	Maximum byte count is used by the PI7C9X112SL when generating memory
	Byte Count		read requests on the PCIe link in response to a memory read initiated on the
			PCI bus and bit [9:8], bit [7:6], and bit [5:4] are set to "full prefetch".
			000: 512 bytes (default)
			001: 128 bytes
			010: 256 bytes
			011: 512 bytes
			100: 1024 bytes

			1: Enable arbitration for master 8
			Reset to 1

## 5.3.35 ARBITER MODE REGISTER – OFFSET 48h

BIT	FUNCTION	TYPE	DESCRIPTION
9	External Arbitration Bit	RW	=0: Enable internal arbiter (By default)
	(PI7C9X112SL does not		PI7C9X112SL does not support external arbiter; this bit must be set to "0"
	support external arbiter)		for normal operation.
			Reset to 0
10	Broken Master Timeout Enable	RW	0: Broken master timeout disable
			1: This bit enables the internal arbiter to count 16 PCI bus cycles while
			waiting for FRAME_L to become active when a device's PCI bus GNT is
			active and the PCI bus is idle. If the broken master timeout expires, the PCI
			bus GNT for the device is de-asserted.
			Reset to 0
11	Broken Master Refresh	RW	0: A broken master will be ignored forever after de-asserting its REQ_L for
	Enable		at least 1 clock
			1: Refresh broken master state after all the other masters have been served
			once
			Reset to 0
19:12	Arbiter Fairness Counter	RW	08h: These bits are the initialization value of a counter used by the internal
			arbiter. It controls the number of PCI bus cycles that the arbiter holds a
			device's PCI bus GNT active after detecting a PCI bus REQ_L from another
			device. The counter is reloaded whenever a new PCI bus GNT is asserted.
			For every new PCI bus GNT, the counter is armed to decrement when it
			detects the new fall of FRAME_L. If the arbiter fairness counter is set to 00h,
			the arbiter will not remove a device's PCI bus GNT until the device has de-
			asserted its PCI bus REQ.
			Reset to 08h
20	GNT_L Output Toggling Enable	RW	0: GNT_L not de-asserted after granted master assert FRAME_L
			1: GNT_L de-asserts for 1 clock after 2 clocks of the granted master asserting
			FRAME_L
			Reset to 0
21	Reserved	RO	Reset to 0

			1xx: Reserved
			Reset to 000
31:25	Reserved	RO	0000000

## 5.3.54 PCI-X BRIDGE STATUS REGISTER – OFFSET 84h

BIT	FUNCTION	TYPE	DESCRIPTION
2:0	Function Number	RO	Function Number; the function number (AD[10:8] of a type-0 configuration transaction) to which the bridge responds. Reset to 000
7:3	Device Number	RO	<ul> <li>Device Number; the device number (AD[15:11] of a type-0 configuration transaction) is assigned to the bridge by the connection of system hardware. Each time the bridge is addressed by a configuration write transaction, the bridge updates this register with the contents of AD[15:11] of the address phase of the configuration transaction, regardless of which register in the bridge is addressed by the transaction. The bridge is addressed by a configuration write transaction if all of the following are true:</li> <li>The transaction uses a configuration write command.</li> <li>IDSEL is asserted during the address phase.</li> <li>AD[1:0] are 00 (type-0 configuration transaction).</li> <li>AD[10:8] of the configuration address contain the appropriate function number.</li> </ul>
15:8	Bus Number	RO	Reset to 11111Bus Number; It is an additional address from which the contents of the primary bus number register on type-1 configuration space header is read. The bridge uses the bus number, device number, and function number fields to create the completer ID when responding with a split completion to a read 
16	64-bit Device on Primary Bus Interface	RO	64-bit device. Reset to 0
17	133MHz Capable	RO	133MHz capable on primary interface. This bit is always RO. Reset to 0

BIT	FUNCTION	TYPE	DESCRIPTION
18	Split Completion Discarded	RO	This bit is always RO.
			Reset to 0
19	Unexpected Split	RWC	=0: No unexpected split completion has been received.
	Completion		=1: An unexpected split completion has been received with the request ID
			equaled to the bridge's primary port number, device number, and function
			number on the bridge primary interface.
			Reset to 0
20	Split Completion Overrun	RO	This bit is always RO.
			Reset to 0
21	Split Request Delayed	RWC	When this bit is set to 1, a split request is delayed because PI7C9X112SL is
			not able to forward the split request transaction to its primary bus due to
			insufficient room within the limit specified in the split transaction
			commitment limit field of the downstream split transaction control register
			Reset to 0
31:22	Reserved	RO	000000000

## 5.3.55 UPSTREAM SPLIT TRANSACTION REGISTER - OFFSET 88h

BIT	FUNCTION	TYPE	DESCRIPTION
15:0	Upstream Split Transaction Capability	RO	Upstream Split Transaction Capability specifies the size of the buffer (in the unit of ADQs) to store split completions for memory read. It applies to the requesters on the secondary bus in addressing the completers on the primary bus. The 0010h value shows that the buffer has 16 ADQs or 2K bytes storage Reset to 0010h
31:16	Upstream Split Transaction Commitment Limit	RW	Upstream Split Transaction Commitment Limit indicates the cumulative sequence size of the commitment limit in units of ADQs. This field can be programmed to any value or equal to the content of the split capability field. For example, if the limit is set to FFFFh, PI7C9X112SL is allowed to forward all split requests of any size regardless of the amount of buffer space available. The split transaction commitment limit is set to 0010h that is the same value as the split transaction capability.

## 5.3.56 DOWNSTREAM SPLIT TRANSACTION REGISTER - OFFSET 8Ch

BIT	FUNCTION	TYPE	DESCRIPTION
15:0	Downstream Split Transaction Capability	RO	Downstream Split Transaction Capability specifies the size of the buffer (in the unit of ADQs) to store split completions for memory read. It applies to the requesters on the primary bus in addressing the completers on the secondary bus. The 0010h value shows that the buffer has 16 ADQs or 2K bytes storage Reset to 0010h
31:16	Downstream Split Transaction Commitment Limit	RW	Downstream Split Transaction Commitment Limit indicates the cumulative sequence size of the commitment limit in units of ADQs. This field can be programmed to any value or equal to the content of the split capability field. For example, if the limit is set to FFFFh, PI7C9X112SL is allowed to forward all split requests of any size regardless of the amount of buffer space available. The split transaction commitment limit is set to 0010h that is the same value as the split transaction capability. Reset to 0010h

### 5.3.57 POWER MANAGEMENT ID REGISTER - OFFSET 90h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Power Management ID	RO	Power Management ID Register
			Reset to 01h

## 5.3.58 NEXT CAPABILITY POINTER REGISTER - OFFSET 90h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Next Pointer	RO	Next pointer (point to Subsystem ID and Subsystem Vendor ID)
			-
			Reset to A8h

#### 5.3.59 POWER MANAGEMENT CAPABILITY REGISTER - OFFSET 90h

BIT	FUNCTION	TYPE	DESCRIPTION
18:16	Version Number	RO	Version number that complies with revision 2.0 of the PCI Power Management Interface specification.
			Reset to 010
19	PME Clock	RO	PME clock is not required for PME_L generation
			Reset to 0
20	Reserved	RO	Reset to 0
21	Device Specific Initialization (DSI)	RO	DSI – no special initialization of this function beyond the standard PCI configuration header is required following transition to the D0 un-initialized state
			Reset to 0
24:22	AUX Current	RO	000: 0mA
			001: 55mA
			010: 100mA
			011: 160mA
			100: 220mA
			101: 270mA
			110: 320mA
			111: 375mA
			Reset to 001
25	D1 Power Management	RO	D1 power management is not supported
			Reset to 0
26	D2 Power Management	RO	D2 power management is not supported
			Reset to 0
31:27	PME_L Support	RO	PME_L is supported in D3 cold, D3 hot, and D0 states.
			Reset to 11001

#### 5.3.60 POWER MANAGEMENT CONTROL AND STATUS REGISTER - OFFSET 94h

BIT	FUNCTION	TYPE	DESCRIPTION
1:0	Power State	RW	Power State is used to determine the current power state of PI7C9X112SL. If a non-implemented state is written to this register, PI7C9X112SL will ignore the write data. When present state is D3 and changing to D0 state by
			programming this register, the power state change causes a device reset without activating the RESET_L of PCI bus interface
			00: D0 state
			01: D1 state not implemented
			10: D2 state not implemented
			11: D3 state
			Reset to 00
7:2	Reserved	RO	Reset to 000000
8	PME Enable	RWS	0: PME_L assertion is disabled
			1: PME_L assertion is enabled
			Reset to 0

BIT	FUNCTION	TYPE	DESCRIPTION
12:9	Data Select	RO	Data register is not implemented
			Reset to 0000
14:13	Data Scale	RO	Data register is not implemented
			Reset to 00
15	PME Status	RWCS	PME_L is supported
			Reset to 0

## 5.3.61 PCI-TO-PCI SUPPORT EXTENSION REGISTER - OFFSET 94h

BIT	FUNCTION	TYPE	DESCRIPTION
21:16	Reserved	RO	Reset to 000000
22	B2/B3 Support	RO	0: B2 / B3 not support for D3hot
			Reset to 0
23	PCI Bus Power/Clock Control Enable	RO	0: PCI Bus Power/Clock Disabled
			Reset to 0
31:24	Data Register	RO	Data register is not implemented
			Reset to 00h

#### 5.3.62 RESERVED REGISTERS – OFFSET 98h – 9Ch

#### 5.3.63 CAPABILITY ID REGISTER – OFFSET A0h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Capability ID	RO	Capability ID for Slot Identification. SI is off by default but can be turned on through EEPROM interface Reset to 04h

## 5.3.64 NEXT POINTER REGISTER - OFFSET A0h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Next Pointer	RO	Next pointer - points to PCI Express capabilities register
			Reset to B0h

#### 5.3.65 SLOT NUMBER REGISTER – OFFSET A0h

BIT	FUNCTION	TYPE	DESCRIPTION
20:16	Expansion Slot Number	RW	Expansion slot number
			Reset to 00000
21	First In Chassis	RW	First in chassis
			Reset to 0
23:22	Reserved	RO	Reset to 00

## 5.3.66 CHASSIS NUMBER REGISTER - OFFSET A0h

BIT	FUNCTION	TYPE	DESCRIPTION
31:24	Chassis Number	RW	Chassis number
			Reset to 00h

PERICOM<sup>®</sup>

## 5.3.67 SECONDARY CLOCK AND CLKRUN CONTROL REGISTER – OFFSET A4h

BIT	FUNCTION	TYPE	DESCRIPTION
1:0	S_CLKOUT0 Enable	RW	S_CLKOUT (Slot 0) Enable
			00: enable S_CLKOUT0
			01: enable S_CLKOUT0
			10: enable S_CLKOUT0
			11: disable S_CLKOUT0 and driven LOW
			Reset to 00
3:2	S_CLKOUT1 Enable	RW	S_CLKOUT (Slot 1) Enable for
			00: enable S_CLKOUT1
			01: enable S_CLKOUT1
			10: enable S_CLKOUT1
			11: disable S_CLKOUT1 and driven LOW
			Reset to 00
5:4	S_CLKOUT2 Enable	RW	S_CLKOUT (Slot 2) Enable for
			00: enable S_CLKOUT2
			01: enable S_CLKOUT2
			10: enable S_CLKOUT2
			11: disable S_CLKOUT2 and driven LOW
			Reset to 00
7:6	S_CLKOUT3 Enable	RW	S_CLKOUT (Slot 3) Enable for
			00: enable S_CLKOUT3
			01: enable S_CLKOUT3
			10: enable S_CLKOUT3
			11: disable S_CLKOUT3 and driven LOW
			Reset to 00
8	Reserved	RO	Reset to 0h
9	Reserved	RO	Reset to 0h
10	Reserved	RO	Reset to 0h
11	Reserved	RO	Reset to 0h
12	Reserved	RO	Reset to 0h
13	Secondary Clock Stop Status	RO	Secondary clock stop status
			0: secondary clock not stopped
			1: secondary clock stopped
			Reset to 0
14	Secondary Clkrun Protocol	RW	0: disable protocol
17	Enable	17.11	1: enable protocol
			· · · · · · · · · · · · · · · · · · ·
			Reset to 0
15	Clkrun Mode	RW	0: Stop the secondary clock only when bridge is at D3hot state
			1: Stop the secondary clock whenever the secondary bus is idle and there are
			no requests from the primary bus
			Reset to 0
16	ASPM L0s enable control	RW	0: bridge may enter ASPM L0s regardless if Receiver is Electrical Idle
			1: bridge may enter ASPM L0s only if Receiver is Electrical Idle
19.17	Saramhling aantral	RW	Reset to 1 Reset to 0
18:17 31:19	Scrambling control Reserved	RO	Reset to 0
51.17	ועבאבו אבע	NU	

#### 5.3.68 CAPABILITY ID REGISTER - OFFSET A8h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Capability ID	RO	Capability ID for subsystem ID and subsystem vendor ID
			Reset to 0Dh

#### 5.3.69 NEXT POINTER REGISTER – OFFSET A8h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Next Item Pointer	RO	Next item pointer (point to PCI Express Capability by default but can be programmed to A0h if Slot Identification Capability is enabled) Reset to B0h

#### 5.3.70 RESERVED REGISTER – OFFSET A8h

BIT	FUNCTION	TYPE	DESCRIPTION
31:16	Reserved	RO	Reset to 0000h

#### 5.3.71 SUBSYSTEM VENDOR ID REGISTER – OFFSET ACh

BIT	FUNCTION	TYPE	DESCRIPTION
15:0	Subsystem Vendor ID	RO	Subsystem vendor ID identifies the particular add-in card or subsystem
			Reset to 00h

#### 5.3.72 SUBSYSTEM ID REGISTER – OFFSET ACh

BIT	FUNCTION	TYPE	DESCRIPTION
31:16	Subsystem ID	RO	Subsystem ID identifies the particular add-in card or subsystem
			Reset to 00h

#### 5.3.73 PCI EXPRESS CAPABILITY ID REGISTER – OFFSET B0h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	PCI Express Capability ID	RO	PCI Express capability ID
			Reset to 10h

### 5.3.74 NEXT CAPABILITY POINTER REGISTER – OFFSET B0h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Next Item Pointer	RO	Next Capabilities Pointer Register
			Reset to F0h

### 5.3.75 PCI EXPRESS CAPABILITY REGISTER - OFFSET B0h

BIT	FUNCTION	TYPE	DESCRIPTION
19:16	Capability Version	RO	Reset to 1h

BIT	FUNCTION	TYPE	DESCRIPTION
23:20	Device / Port Type	RO	0000: PCI Express endpoint device
			0001: Legacy PCI Express endpoint device
			0100: Root port of PCI Express root complex
			0101: Upstream port of PCI Express switch
			0110: Downstream port of PCI Express switch
			0111: PCI Express to PCI bridge
			1000: PCI to PCI Express bridge
			Others: Reserved
			Reset to 7h
24	Slot Implemented	RO	Reset to 0
29:25	Interrupt Message Number	RO	Reset to 0h
31:30	Reserved	RO	Reset to 0

## 5.3.76 DEVICE CAPABILITY REGISTER – OFFSET B4h

BIT	FUNCTION	TYPE	DESCRIPTION
2:0	Maximum Payload Size	RO	000: 128 bytes
			001: 256 bytes
			010: 512 bytes
			011: 1024 bytes
			100: 2048 bytes
			101: 4096 bytes
			110: reserved
			111: reserved
			Reset to 2h
4:3	Phantom Functions	RO	No phantom functions supported
			Reset to 00
5	8-bit Tag Field	RO	8-bit tag field supported
5	8-bit Tag Field	KÜ	s-on tag new supported
			Reset to 1
8:6	Endpoint L0's Latency	RO	Endpoint L0's acceptable latency
			000: less than 64 ns
			001: 64 – 128 ns
			010: 128 – 256 ns
			011: 256 – 512 ns 100: 512 ns – 1 us
			100.512  Hs - 1  us 101: 1 - 2  us

31:23	Reserved	RO	Reset to 0

## 5.3.85 XPIP CONFIGURATION REGISTER 0 – OFFSET CCh

BIT	FUNCTION	TYPE	DESCRIPTION
0	Hot Reset Enable	RW	Reset to 0
1	Loopback Function Enable	RW	Reset to 0
2	Cross Link Function Enable	RW	Reset to 0
3	Software Direct to Configuration State when in LTSSM state	RW	Reset to 0
4	Internal Selection for Debug Mode	RW	Reset to 0
7:5	Negotiate Lane Number of Times	RW	Reset to 3h
12:8	TS1 Number Counter	RW	Reset to 10h
15:13	Reserved	RO	Reset to 0
31:16	LTSSM Enter L1 Timer Default Value	RW	Reset to 0400h

## 5.3.86 XPIP CONFIGURATION REGISTER 1 – OFFSET D0h

BIT	FUNCTION	TYPE	DESCRIPTION
9:0	L0's Lifetime Timer	RW	Reset to 0
15:10	Reserved	RO	Reset to 0
31:16	L1 Lifetime Timer	RW	Reset to 0

## 5.3.87 XPIP CONFIGURATION REGISTER 2 – OFFSET D4h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	CDR Recovery Time (in the	RW	Reset to 54h
	number of FTS order sets)		A Fast Training Sequence order set composes of one K28.5 (COM) Symbol
			and three K28.1 Symbols.
14:8	L0's Exit to L0 Latency	RW	Reset to 2h
15	RXP/RXN polarity inversion	RW	Reset to 0, when set to 1, enable RXP/RXN polarity inversion
22:16	L1 Exit to L0 Latency	RW	Reset to 19h
23	Reserved	RO	Reset to 0

### 5.3.88 L0 ENTER L1 WAITING PERIOD COUNTER - OFFSET D4h

BIT	FUNCTION	TYPE	DESCRIPTION
31:24	L0 enter L1 waiting period	RW	L0 enter L1 waiting period counter
	counter		=d0: 128ms
			=d1: 129ms
			=d127: 256ms
			=d128: 0ms
			=d129: 1ms
			=d255: 127ms
			Reset to 00h

## 5.3.89 CAPABILITY ID REGISTER - OFFSET D8h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Capability ID for VPD	RO	Reset to 03h
	Register	1	

## 5.3.90 NEXT POINTER REGISTER – OFFSET D8h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Next Pointer	RO	Next pointer (F0h, points to MSI capabilities)
			Reset to F0h

#### 5.3.91 VPD REGISTER – OFFSET D8h

17:16	Reserved		
	Reserved	RO	Reset to 0
23:18	VPD Address for Read/Write Cycle	RW	Reset to 0
30:24	Reserved	RO	Reset to 0
31	VPD Operation	RW	<ul> <li>0: Generate a read cycle from the EEPROM at the VPD address specified in bits [7:2] of offset D8h. This bit remains at '0' until EEPROM cycle is finished, after which the bit is then set to '1'. Data for reads is available at register ECh.</li> <li>1: Generate a write cycle to the EEPROM at the VPD address specified in bits [7:2] of offset D8h. This bit remains at '1' until EEPROM cycle is finished, after which it is then cleared to '0'.</li> <li>Reset to 0</li> </ul>

## 5.3.92 VPD DATA REGISTER – OFFSET DCh

BIT	FUNCTION	TYPE	DESCRIPTION
31:0	VPD Data	RW	VPD Data (EEPROM data [address + 0x40])
			The least significant byte of this register corresponds to the byte of VPD at the address specified by the VPD address register. The data read form or written to this register uses the normal PCI byte transfer capabilities.
			Reset to 0

#### 5.3.93 RESERVED REGISTERS – OFFSET E0h – ECh

#### 5.3.94 MESSAGE SIGNALED INTERRUPTS ID REGISTER – F0h

BIT	FUNCTION	TYPE	DESCRIPTION
7:0	Capability ID for MSI	RO	Reset to 05h
	Registers		

#### 5.3.95 NEXT CAPABILITIES POINTER REGISTER – F0h

BIT	FUNCTION	TYPE	DESCRIPTION
15:8	Next Pointer	RO	Next pointer (00h indicates the end of capabilities)
			Reset to 00h

#### 5.3.96 MESSAGE CONTROL REGISTER – OFFSET F0h

BIT	FUNCTION	TYPE	DESCRIPTION
16	MSI Enable	RW	0: Disable MSI and default to INTx for interrupt
			1: Enable MSI for interrupt service and ignore INTx interrupt pins
19:17	Multiple Message Capable	RO	000: 1 message requested
			001: 2 messages requested

## 5.3.133 RESERVED REGISTERS - OFFSET 314h - FFCh

# 6 GPIO PINS AND SM BUS ADDRESS

- GPIO[0]: PCI slot Card Presence Detection Input
- GPIO[1]: Attention Button Pressed Input
- GPIO[2]: Power Indication Output
- GPIO[3]: Attention Indication Output

GPIO[3:0] are defined for SMBUS device ID if TM0=1.

GPIO[3:0], with internal arbiter enabled, are being used as REQ[7:4] pins to provide PCI arbitration to 8 PCI Masters.

GPIO[3:0] can be further defined to serve other functions in the further generations.

The address-strapping table of SMBUS with GPIO [3:0] pins is defined in the following table:

#### Table 6-1 SM Bus Device ID Strapping

SM Bus Address Bit	SM Bus device ID
Address bit [7]	= 1
Address bit [6]	= 1
Address bit [5]	= 0
Address bit [4]	= GPIO [3]
Address bit [3]	= GPIO [2]
Address bit [2]	= GPIO [1]
Address bit [1]	= GPIO [0]

# 7 CLOCK SCHEME

#### PCI Express interface:

PI7C9X112SL requires 100MHz differential clock inputs through the pins of REFCLKP and REFCLKN.

When the clock applied to PI7C9X112SLB and other end of the PCIe link are from the same clock source, the MSK\_IN input should be kept unchanged before and after reset (PERST\_L). Otherwise, the MSK\_IN input should be different before and after the reset.

#### PCI interface:

PI7C9X112SL generates four clock outputs, from either external clock input (1MHz to 66MHz) at CLKIN or internal clock generator:

PI7C9X112SL can use configuration control to enable or disable the secondary clock output: CLKOUT[3:0].

PI7C9X112SL used either internally feedbacked clock from CLKOUT[0] or external clock input applied at CLKOUT[0], for internal secondary interface logic.

For using internal clock source, the internal clock generator needs to be enabled with CLKIN driven high or low. CLKIN and M66EN signals become the selection for PCI Frequency at 50MHz/25MHz or 66MHz/33MHz.

CLKIN	M66EN	PCI Clock	
0	0	33MHz	
0	1	66MHz	
1	0	25MHz	
1	1	50MHz	

Frequency of PCI CLKOUT with internal clock source:

The PI7C9X112SL PCI Clock Outputs, CLKOUT [3:0], can be enabled or disabled through the configuration register.

PI7C9X112SL supports three different implementation of PCI clock.

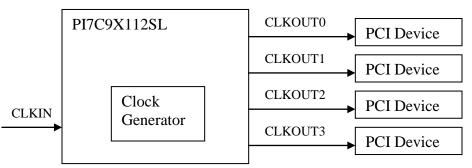

- Internal clock generator, and internal clock buffering.
  - Internal feedback
  - External feedback
- External clock source, and internal clock buffering.
  - Internal feedback
  - External feedback
- External clock source, and external clock buffering.

Topology of internal clock generator and internal clock buffering:

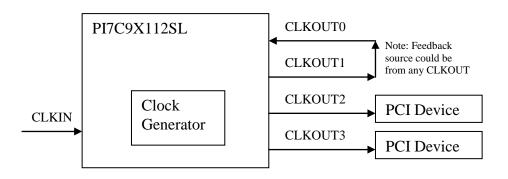

1. Internal Feedback:

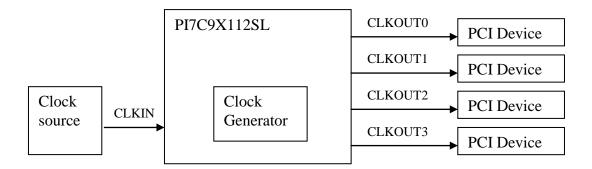

2. External Feedback:

Topology of external clock source and internal clock buffering:

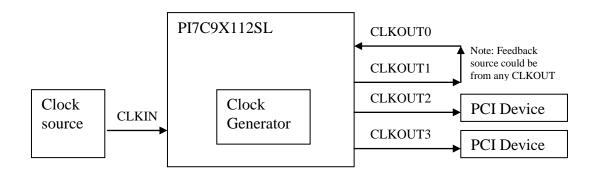

1. Internal Feedback:

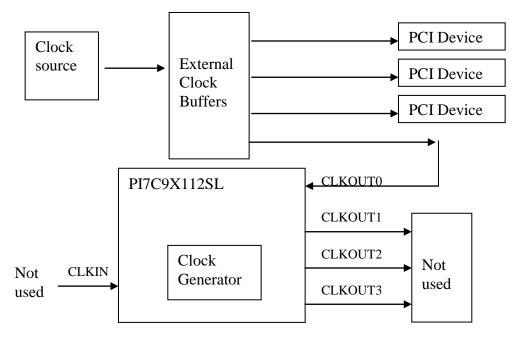

2. External Feedback:

In this configuration, user simply connects the external clock source to CLKIN pin. And user needs to make sure the clock is preset (toggling) before the fundamental reset de-asserted (e.g. PERST\_L). In this mode, the frequency is the same as the input clock source.

Topology of external clock source and external clock buffering:

In this configuration, user simply connects the external clock from the clock buffers to CLKOUT0. And user needs to make sure the clock is preset (toggling) before the fundamental reset de-asserted (e.g. PERST\_L).

# 8 INTERRUPTS

PI7C9X112SL supports interrupt message packets on PCIe side. PI7C9X112SL supports PCI interrupt (INTA, B, C, D) pins or MSI (Message Signaled Interrupts) on PCI side. PCI interrupts and MSI are mutually exclusive. In order words, if MSI is enabled, PCI interrupts will be disabled. PI7C9X112SL support 64-bit addressing MSI.

PI7C9X112SL maps the PCI interrupts pins or MSI, if enabled, on PCI side to interrupt message packets on PCIe side.

There are eight PCIe interrupt message packets. They are Assert\_INTA, Assert\_INTB, Assert\_INTC, Assert\_INTD, Deassert\_INTA, Deassert\_INTB, Deassert\_INTC, and Deassert\_INTD. PI7C9X112SL tracks the PCI interrupt (INTA, INTB, INTC, and INTD) pins and maps them to the eight PCIe interrupt messages. See Table 8-1 for interrupt mapping information.

#### Table 8-1 PCI Interrupt to PCIe Interrupt Message Mapping

PCI Interrupts (from sources of interrupts)	PCIe Interrupt message packets (to host controller)
INTA	INTA message
INTB	INTB message
INTC	INTC message
INTD	INTD message

9

PI7C9X112SL

# EEPROM (I2C) INTERFACE AND SYSTEM MANAGEMENT BUS

# 9.1 EEPROM (I2C) INTERFACE

PI7C9X112SL supports EEPROM interface through I2C bus. In EEPROM interface, pin 3 is the EEPROM clock (SCL) and pin 4 is the EEPROM data (SDL). TM1 and TM0 are strapped accordingly to select EEPROM interface or System Management Bus. EEPROM (I2C) interface is enabled with TM1=0 and TM0=0. When EEPROM interface is selected, SCL is an output. SCL is the I2C bus clock to the I2C device. In addition, SDL is a bi-directional signal for sending and receiving data.

## 9.2 SYSTEM MANAGEMENT BUS

PI7C9X112SL supports SM bus protocol if TM1=0 and TM0=1. In addition, SMBCLK (pin 3) and SMBDAT (pin 4) are utilized as the clock and data pins respectively for the SM bus.

When SM bus interface is selected, SMBCLK pin is an input for the clock of SM bus and SMBDAT pin is an open drain buffer that requires external pull-up resistor for proper operation.

## 9.3 EEPROM AUTOLOAD CONFIGURATION

EEPROM Byte Addresses	Cfg Offset	Description
00-01h		EEPROM signature: Autoload will only proceed if it reads a value of 1516h on the first word loaded.
02h		Region Enable: Enables or disables certain regions of PCI configuration space from being loaded from the EEPROM. bit 0: reserved bit 4-1: 0000=stop autoload at offset 0Bh: Group 1 0001=stop autoload at offset 67h: Group 2 0011=stop autoload at offset AFh: Group 3 0111=stop autoload at offset D7h: Group 4 other combinations are undefined bit 7-5: reserved
03h		Enable Miscellaneous functions: (for transparent mode only) bit 0: ISA Enable control bit write protect: when this bit is set, 9x111 will change the bit 2 of 3Eh into RO, and ISA enable feature will not be available.

# 10 HOT PLUG OPERATION

PI7C9X112SL is not equipped with standard hot-plug controller (SHPC) integrated. However, PI7C9X112SL supports hot-plug signaling messages and registers to simplify the implementation of hot-plug system.

Using PI7C9X112SL on motherboard:

• PI7C9X112SL supports hot-plug on PCI bus

Using PI7C9X112SL on add-in card:

- PI7C9X112SL supports hot-plug on PCI Express bus. Hot-plug messages will be generated by PI7C9X112SL based on the add-in card conditions.
- PI7C9X112SL expects the REFCLK signal will be provided to its upstream PCI Express Port prior to the de-assertion of RESET. The Downstream PCI Port of PI7C9X112SL supports a range of frequency up to 66MHz.
- PI7C9X112SL also supports subsystem vendor and subsystem ID. PI7C9X112SL will ignore target response while the bus is idle.

PRSNT1# and PRSNT2# are not implemented on both PI7C9X112SL. The use of these two signals is mandatory on an add-in card in order to support hot-plug.

# 11 RESET SCHEME

PI7C9X112SL requires the fundamental reset (PERST\_L) input for internal logic. Also, PI7C9X112SL has a power-on-reset (POR) circuit to detect VDDCAUX power supply for auxiliary logic control.

#### • Cold Reset:

A cold reset is a fundamental or power-on reset that occurs right after the power is applied to PI7C9X112SL (during initial power up). See section 7.1.1 of PCI Express to PCI Bridge Specification, Revision 1.0 for details.

#### • Warm Reset:

A warm reset is a reset that triggered by the hardware without removing and re-applying the power sources to PI7C9X112SL.

#### • Hot Reset:

A hot reset is a reset that used an in-band mechanism for propagating reset across a PCIe link to PI7C9X112SL. PI7C9X112SL will enter to training control reset when it receives two consecutive TS1 or TS2 order-sets with reset bit set.

• DL\_DOWN Reset:

If the PCIe link goes down, the Transaction and Data Link Layer will enter DL\_DOWN status. PI7C9X112SL discards all transactions and returns all logic and registers to initial state except the sticky registers.

Upon receiving reset (cold, warm, hot, or DL\_DOWN) on PCIe interface, PI7C9X112SL will generate PCI reset (RESET\_L) to the downstream devices on the PCI bus. The PCI reset de-assertion follows the de-assertion of the reset received from PCIe interface. The reset bit of Bridge Control Register may be set depending on the application. PI7C9X112SL will tolerant to receive and process SKIP order-sets at an average interval between 1180 to 1538 Symbol Times. PI7C9X112SL does not keep PCI reset active when VD33 power is off even though VAUX (3.3v) is supported. It is recommended to add a weak pull-down resistor on its application board to ensure PCI reset is low when VD33 power is off (see section 7.3.2 of PCI Bus Power management Specification Revision 1.1).

PI7C9X112SL transmits one Electrical Idle order-set and enters to Electrical Idle.

# 12 IEEE 1149.1 COMPATIBLE JTAG CONTROLLER

An IEEE 1149.1 compatible Test Access Port (TAP) controller and associated TAP pins are provided to support boundary scan in PI7C9X112SL for board-level continuity test and diagnostics. The TAP pins assigned are TCK, TDI, TDO, TMS and TRST\_L. All digital input, output, input/output pins are tested except TAP pins.

The IEEE 1149.1 Test Logic consists of a TAP controller, an instruction register, and a group of test data registers including Bypass and Boundary Scan registers. The TAP controller is a synchronous 16-state machine driven by the Test Clock (TCK) and the Test Mode Select (TMS) pins. An independent power on reset circuit is provided to ensure the machine is in TEST\_LOGIC\_RESET state at power-up. The JTAG signal lines are not active when the PCI resource is operating PCI bus cycles.

## 12.1 INSTRUCTION REGISTER

PI7C9X112SL implements a 5-bit Instruction register to control the operation of the JTAG logic. The defined instruction codes are shown in Table 12-1. Those bit combinations that are not listed are equivalent to the BYPASS (11111) instruction:

Instruction	<b>Operation Code (binary)</b>	Register Selected	Operation
EXTEST	00000	Boundary Scan	Drives / receives off-chip test data
SAMPLE	00001	Boundary Scan	Samples inputs / pre-loads outputs
HIGHZ	00101	Bypass	Tri-states output and I/O pins except TDO pin
CLAMP	00100	Bypass	Drives pins from boundary-scan register and selects Bypass register
			for shifts
IDCODE	01100	Device ID	Accesses the Device ID register, to read manufacturer ID, part
			number, and version number
BYPASS	11111	Bypass	Selected Bypass Register
INT_SCAN	00010	Internal Scan	Scan test
MEM_BIST	01010	Memory BIST	Memory BIST test

#### Table 12-1 Instruction Register Codes

## 12.2 BYPASS REGISTER

The required bypass register (one-bit shift register) provides the shortest path between TDI and TDO when a bypass instruction is in effect. This allows rapid movement of test data to and from other components on the board. This path can be selected when no test operation is being performed on the PI7C9X112SL.

## 12.3 DEVICE ID REGISTER

This register identifies Pericom as the manufacturer of the device and details the part number and revision number for the device.

Bit	Туре	Value	Description
31:28	RO	01h	Version number
27:12	RO	E110h	Last 4 digits (hex) of the die part number
11:1	RO	23Fh	Pericom identifier assigned by JEDEC
0	RO	1b	Fixed bit equal to 1'b1

#### Table 12-2 JTAG device ID register

## 12.4 BOUNDARY SCAN REGISTER

The boundary scan register has a set of serial shift-register cells. A chain of boundary scan cells is formed by connected the internal signal of the PI7C9X112SL package pins. The VDD, VSS, and JTAG pins are not in the boundary scan chain. The input to the shift register is TDI and the output from the shift register is TDO. There are 4 different types of boundary scan cells, based on the function of each signal pin.

The boundary scan register cells are dedicated logic and do not have any system function. Data may be loaded into the boundary scan register master cells from the device input pins and output pin-drivers in parallel by the mandatory SAMPLE and EXTEST instructions. Parallel loading takes place on the rising edge of TCK.

## 12.5 JTAG BOUNDARY SCAN REGISTER ORDER

Table 12-3 JTAG Boundary Scan Register Definition

# 13 POWER MANAGEMENT

PI7C9X112SL supports D0, D3-hot, D3-cold Power States. D1 and D2 states are not supported. The PCI Express Physical Link Layer of the PI7C9X112SL device supports the PCI Express Link Power Management with L0, L0s, L1, L2/L3 ready and L3 Power States. For the PCI Port of PI7C9X112SL, it supports the standard PCI Power Management States with B0, B1, B2 and B3.

During D3-hot state, the main power supplies of VDDP, VDDC, and VD33 can be turned off to save power while keeping the VDDAUX, VDDCAUX, and VAUX with the auxiliary power supplies to maintain all necessary information to be restored to the full power D0 state. PI7C9X112SL has been designed to have sticky registers that are powered by auxiliary power supplies. PME\_L pin allows PCI devices to request power management state changes. Along with the operating system and application software, PCI devices can achieve optimum power saving by using PME\_L. PI7C9X112SL converts PME\_L signal information to power management messages to the upstream switches or root complex.

PI7C9X112SL also supports ASPM (Active State Power Management) to facilitate the link power saving.

PI7C9X112SL supports beacon generation but does not support WAKE# signal during power management.

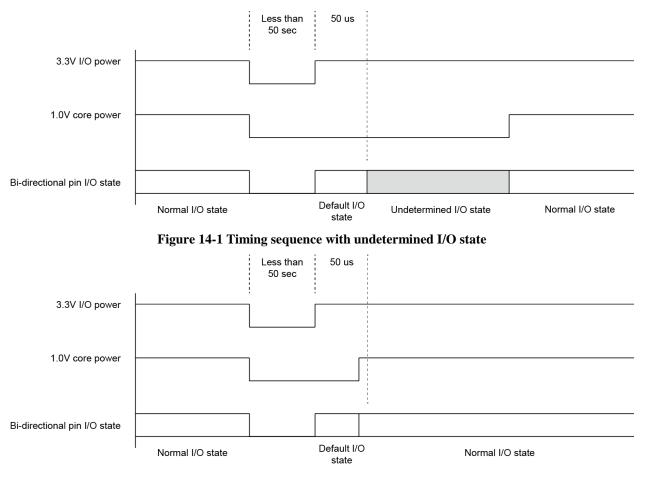

# 14 POWER SEQUENCING

The PI7C9X112SL requires two voltages: 3.3V I/O voltage and 1.0V core voltage. The 1.0V VDDCAUX is consider the same as core voltage, and can be combined as one. When designing the power supplies for PI7C9X112SL, the user can either apply ALL voltages at the same time, or turn on the higher voltage (3.3V) first, followed by the lower voltages (1.0V) within suggested limits. If all power rails are not applied at the same time, the PI7C9X112SL will not be damaged as long as 3.3V is applied either before or at the same time as 1.0V.

During power cycle, if there is a delay in applying 1.0V core voltage after the 3.3V is applied, the internal logic might be placed in an unknown state if the power off period is not long enough to cause the device totally discharged. This condition in turn may produce undetermined I/O states on some pins. If the core logic is totally discharged before applying 3.3V, then all bi-directional I/O pins will stay at their default states.

The typical time for PI7C9X112SL to discharge completely is less than 3 seconds, but in extreme cases this period can be as long as 50 seconds. Certain precautions should be made if the delay between 3.3V and 1.0V is larger than 50us. Figure 14-1 below shows the I/O timing sequence with undetermined I/O state, and Figure 14-2 shows the recommended power sequence timing.

When 1.0V core power is applied after 3.3V IO power is applied, there might be glitch at reset pins (PERST\_L and RESET\_L), and an external RC filter can be used to filter out the glitch if necessary.

## 14.1 INITIAL POWER-UP (G3 TO L0)

As long as PERST# is active, all PCI Express functions are held in reset. The main supplies ramp up to their specified levels (3.3 V and 12 V). Sometime during this stabilization time, the REFCLK starts and stabilizes. After there has been time ( $T_{PVPERL}$ ) for the power and clock to become stable, PERST# is deasserted high and the PCI Express functions can start up.

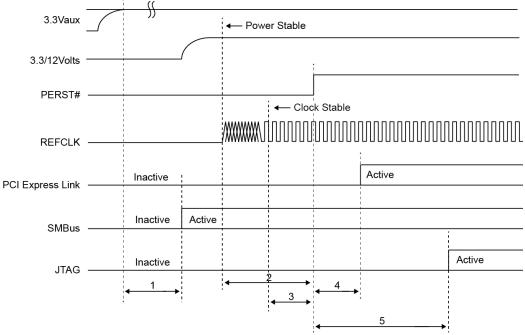

Figure 14-3 Initial Power-up

- 1. 3.3Vaux stable to SMBus driven (optional). If no 3.3Vaux on platform, the delay is from +3.3V stable
- 2. Minimum time from power rails within specified tolerance to PERST# inactive (T<sub>PVPERL</sub>)
- 3. Minimum clock valid to PERST# inactive (T<sub>PERST-CLK</sub>)
- 4. Minimum PERST# inactive to PCI Express link out of electrical idle
- 5. Minimum PERST# inactive to JTAG driven (optional)

Symbol	Parameter	Min	Max	Units
$T_{PVPERL}^{1}$	Power stable to PERST# inactive	100		ms
T <sub>PERST-CLK</sub> <sup>2</sup>	REF CLK stable before PERST# inactive	100		μs
T <sub>PERST</sub>	PERST# active time	100		μs
T <sub>FAIL</sub> <sup>3</sup>	Power level invalid to PERST# active		500	ns
$T_{WKRF}^{4}$	WAKE# rise – fall time		100	ns

Note:

1. Any supplied power is stable when it meets the requirements specified for that power supply.

2. A supplied reference clock is stable when it meets the requirements specified for the reference clock. The PEREST# signal is asserted and de-asserted asynchronously with respect to the supplied reference clock.

3. The PEREST# signal must be asserted within T<sub>FAIL</sub> of any supplied power going out specification.

4. Measured from WAKE# assertion/de-assertion to valid input level at the system PM controller. Since WAKE# is an open-drain signal, the rise time is dependent on the total capacitance on the platform and the system board pull-up resistor. It is the responsibility of the system designer to meet the rise time specification.

## 14.2 POWER-OFF SEQUENCE

The power off sequence is the reverse of the power on sequence, that is, asserts the PERST# first, then after  $T_{PERST\_CLK}$  disable the REFCLK, and power off core power and I/O power, but I/O power off should be the same time or later than the core power off.

# 15 ELECTRICAL AND TIMING SPECIFICATIONS

## 15.1 ABSOLUTE MAXIMUM RATINGS

#### **Table 15-1 Absolute Maximum Ratings**

(Above which the useful life may be impaired. For user guidelines, not tested.)

Item	Absolute Max. Rating
Storage Temperature	-65°C to 150°C
PCI Express supply voltage to ground potential (VDDA, VDDP, VDDC, VDDAUX, and VDDCAUX)	-0.3v to 1.2v
PCI Express Termination Supply Voltage to ground potential (VTT)	-0.3v to 2.0v
PCI supply voltage to ground potential (VD33 and VAUX)	-0.3v to 3.8v
DC input voltage for PCI Express signals	-0.3v to 1.2v
DC input voltage for PCI signals	-0.3v to 5.75v

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

## 15.2 DC SPECIFICATIONS

Table 15-2 DC Electrical Characteristics
--

Symbol	Description	Condition	Min.	Typ.	Max.	Unit
VDDA	Analog Power Supply for PCI Express Interface		0.9	1.0	1.1	V
VDDP	Digital Power Supply for PCI Express Interface		0.9	1.0	1.1	V
VDDC	Digital Power Supply for the Core		0.9	1.0	1.1	V
VDDAUX	Digital Auxiliary Power Supply for PCI Express Interface		0.9	1.0	1.1	V
VDDCAUX	Digital Auxiliary Power Supply for the Core		0.9	1.0	1.1	V
VTT	Termination Power Supply for PCI Express Interface		1.0	1.5	1.8	V
VD33	Digital Power Supply for PCI Interface		3.0	3.3	3.6	V
VAUX	Digital Auxiliary Power Supply for PCI Interface		3.0	3.3	3.6	V
V <sub>IH</sub>	PCI Input High Voltage		1.55		5.5	V
V <sub>IL</sub>	PCI Input Low Voltage		-0.3		1.08	V
I <sub>IL</sub>	PCI Input Leakage Current	0 <v<sub>IN<vd33< td=""><td></td><td></td><td>±10</td><td>μA</td></vd33<></v<sub>			±10	μA
V <sub>OH</sub>	PCI Output High Voltage	$I_{out} = -500 \mu A$	2.7			V
V <sub>OL</sub>	PCI Output Low Voltage	$I_{out} = 1500 \mu A$			0.36	V
C <sub>IN</sub>	PCI Input Pin Capacitance				10	pF
C <sub>CLK</sub>	PCI CLK Pin Capacitance		5		12	pF
C <sub>IDSEL</sub>	PCI IDSEL Pin Capacitance				8	pF

In order to support auxiliary power management fully, it is recommended to have VDDP and VDDAUX separated. By the same token, VD33/VDDC and VAUX/VDDCAUX need to be separated for auxiliary power management support. However, if auxiliary power management is not required, VD33 and VDDC can be connected to VAUX and VDDCAUX respectively.

The typical power consumption of PI7C9X112SL is less than 0.45 watt.

PI7C9X112SL is capable of sustaining 1500V human body model for the ESD protection without any damages.

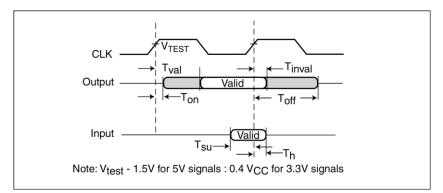

# 15.3 AC SPECIFICATIONS

#### **Table 15-3 PCI Bus Timing Parameters**

Symbol	Parameter	66 MHz		33 MHz		Units
Symbol		MIN	MAX	MIN	MAX	Omts
Tsu	Input setup time to CLK – bused signals <sup>1,2,3</sup>	3	-	7	-	
Tsu (ptp)	Input setup time to CLK – point-to-point <sup>1,2,3</sup>	5	-	$10, 12^4$	-	
Th	Input signal hold time from CLK <sup>1,2</sup>	0	-	0	-

Item	Low	High	Unit			
Ambient Temperature with power applied	-40	85	°C			

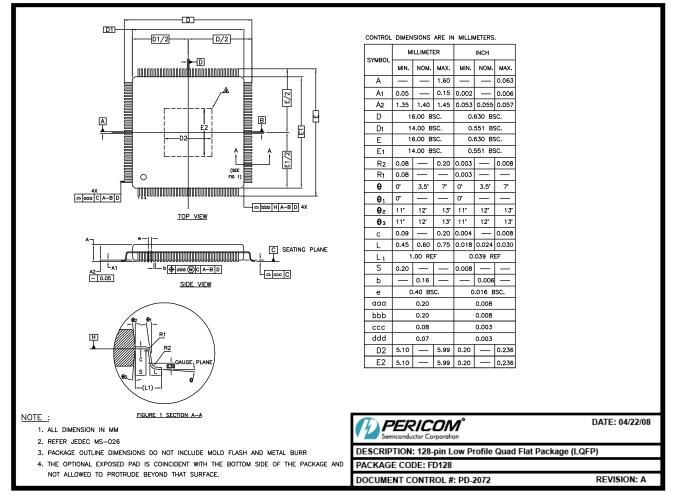

Note: Exposure to high temperature conditions for extended periods of time may affect reliability.

# 16 PACKAGE INFORMATION

The package of PI7C9X112SL comes in 14mm x 14mm LQFP (128 Pin) package. The pin pitch is 0.4mm. This package also includes an exposed ground on the bottom surface of the package. Pericom highly recommends implementing this exposed ground pad on any customer boards. The following are the package information and mechanical dimension:

07-0353
