

OBSELETE - PART DISCONTINUED

Description

The ZMT32 is a thin film permalloy magnetic field sensor, which contains two galvanic isolated Wheatstone Bridges for high precision angle measurement applications under low field conditions. This angle sensor is based on the anisotropic magnetoresistive effect (AMR). The two internal (V_{CC1} , V_{CC2}) bridges enclose a relative sensitive angle of 45 degrees. The input field is a rotating magnetic field in the chip plane (parallel to the surface of package). This rotating field will make available two independent sinusoidal output signals with the following relationship

$$\frac{V_{O2}}{V_{O1}} = \frac{\sin(2\alpha)}{\cos(2\alpha)} = \tan(2\alpha)$$

where α = angle between sensor axis and field direction

The precise ZMT32 works with low field applications ($H_{rot} = 8$ to 25kA/m), much lower than similar devices. The ultimate output signal quality depends on the external magnetic material and on the mechanical realization.

The ZMT32 is a passive part and the Arc-Tangent interpolation needs external signal processing. Typical areas of application are angle and speed measurement.

Features

- contactless angle measurement up to 180°
- flexible measuring solutions for moved systems
- stable operation over long time
- high temperature range up to $+160^\circ\text{C}$
- **For automotive applications requiring specific change control (i.e. parts qualified to AEC-Q100/101/200, PPAP capable, and manufactured in IATF 16949 certified facilities), please [contact us](mailto:contact@diodes.com) or your local Diodes representative. <https://www.diodes.com/quality/product-definitions/>**

Pin Assignments

Applications

- angle and angular velocity measuring systems
- absolute angle and angle change
- automotive electronic (steering, throttle control, pedal positioning, etc)
- contactless rotary switches and potentiometer
- automatic adjustment

Absolute Maximum Ratings

Parameter	Symbol	Limit	Unit
Supply Voltages	V_{cc1} and V_{cc2}	10	V
Single Bridge Current	I_{cc1} or I_{cc2}	4	mA
Operating Temperature Range	T_A	-40 to +160	°C
Storage Temperature Range	T_{stg}	-55 to +175	°C

Recommended Operating Conditions

Symbol	Parameter	Min	Typ	Max	Unit
V_{cc1}, V_{cc2}	Supply Voltages		5	8.5	V
H_{rot}	Applied Magnetic Field Strength	8	25		kA/m

		$H_{\text{ROT}} = 8\text{ kA/m}^{(\ddagger)}$			0.5 (‡)	deg
$I_{\text{iso1-2}}$	Isolation Bridge Current	no H_{ROT}	0		0.1	μA

NOTES:

(*) Typical values apply to an ambient temperature of 23°C

(†) See point "Magnetic Field Tests" below

(‡) The accurate control of this parameter ($\text{Lim}_{\text{max}} = 0.1\text{deg}$, $H_{\text{ROT}} = 25\text{kA/m}$) takes place by means of sample tests

Electrical Characteristics (continued)

A: Output characteristic definitions

$$\Delta V_{O1}/V_{CC1} = (V_{OMAX1} - V_{OMIN1})/V_{CC1} \quad \text{or/} \quad \Delta V_{O2}/V_{CC2} = (V_{OMAX2} - V_{OMIN2})/V_{CC2}$$

$$V_{OFF1}/V_{CC1} = \frac{1}{2}(V_{OMAX1} + V_{OMIN1})/V_{CC1} \quad \text{or/} \quad V_{OFF2}/V_{CC2} = \frac{1}{2}(V_{OMAX2} + V_{OMIN2})/V_{CC2}$$

$$\Delta\alpha H = \text{MAX} | \alpha_{\text{LEFT TURN}} - \alpha_{\text{RIGHT TURN}} | \quad (\text{max. angular difference between left and right turn})$$

$$\Delta\alpha = \text{MAX} | \alpha_o - \alpha | \quad (\text{max. angular difference between actual value } \alpha_o \text{ and measured angle, without offset error})$$

B: Temperature coefficient (TC) equations

$$T_1 = -25^\circ\text{C}, \quad T_0 = +25^\circ\text{C}, \quad T_2 = +125^\circ\text{C}$$

$$TCV_O = \frac{1}{T_2 - T_1} \times \frac{\frac{\Delta V_O}{V_{CC}}(T_2) - \frac{\Delta V_O}{V_{CC}}(T_1)}{\frac{\Delta V_O}{V_{CC}}(T_0)} \times 100\%$$

where $\frac{\Delta V_O}{V_{CC}}(T_n)$ is the peak-peak output voltage at temperature T_n

$$TCR_B = \frac{1}{T_2 - T_1} \times \frac{R_B(T_2) - R_B(T_1)}{R_B(T_0)} \times 100\%$$

where $R_B(T_n)$ is the bridge resistance at temperature T_n

$$TCV_{OFF} = \frac{V_{OFF}(T_2) - V_{OFF}(T_1)}{(T_2 - T_1)}$$

where $V_{OFF}(T_n)$ is the output offset voltage at temperature T_n

Magnetic field tests

For these tests a rotating magnetic field is generated and the output signals of both bridges are measured at four different field angles for right rotation as well as for left rotation. Using these measured output signals the diameter and the center coordinates of the best circle are calculated. They correspond to the output voltage range and the offset voltage. Furthermore the field angles for both rotation directions and angular hysteresis are calculated

$$[\text{measured angle}] = \alpha = \arctan\left(\frac{V_{O2}}{V_{O1}}\right)$$

Method

The data pairs are transformed onto a unit circle starting from their position in the data collection for determining direction information or angle information.

It must be evaluated with four pair values (cos, sin) on a right rotation (magnetic field rotation) and four pair values (cos, sin) on a left rotation (magnetic field rotation).

OBSOLETE - PART DISCONTINUED

Electrical Characteristics (continued)

The field rotation steps are:

- start in 180° position
 - § right rotation to 22.5° with measurement of sensor outputs
 - § right rotation to 67.5° with measurement of sensor outputs
 - § right rotation to 112.5° with measurement of sensor outputs
 - § right rotation to 157.5° with measurement of sensor outputs
 - § right rotation to 0° (360°) , stop , reversal
 - § left rotation to 157.5° with measurement of sensor outputs
 - § left rotation to 112.5° with measurement of sensor outputs
 - § left rotation to 67.5° with measurement of sensor outputs
 - § left rotation to 22.5° with measurement of sensor outputs , end position

General description of tests with external magnetic field.

OBSOLETE

OBSOLETE - PART DISCONTINUED

Operating Principle

When a common-magnetic field is applied through the ZMT32 the 2 internal magneto-resistive bridges are affected slightly differently due to their 45° rotation to one another. This 45° rotation enables the ZMT32 to determine angular position, of a rotating magnetic field.

When a rotating magnetic field is applied to the ZMT32 it will output 2 sinusoidal voltages that are:

- proportional to the field strength applied
- proportional to the supply voltage applied,
- rotating at twice the angular position
- 90° apart (as seen below).

By taking the arcTan of the ratio of V_{O2} to V_{O1} the angular position of the magnetic field can be determined.

Characteristic output curves V_{O1} , V_{O2}

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
