

# Adaptive 100/120Hz Current Ripple Remover Max Input Current ≤ 60mA

#### **Features**

- Regulator for adaptive 100/120Hz current ripple remove
- Built-in zener diode for input voltage clamping
- Built-in 100V power MOSFET
- Programmable amplitude LED current ripple
- Programmable maximum cathode voltage of LED
- Programmable maximum LED current
- Optimized for TRIAC dimming
- SOT23-3, SOT23-5 and SOT89-3 packages

#### **Applications**

LED lighting

### **Descriptions**

DIO8241F is a regulator for driving internal NMOSFET to remove the 100/120Hz LED string current ripple on AC/DC power.

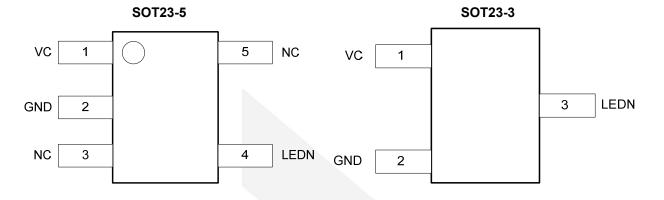

Patented control strategies are optimized for remover current ripple. Nover circuit design makes a lower BOM and high cost-effective for flickerless filament.

# **Absolute Maximum Ratings**

Stresses beyond those listed under "Absolute Maximum Rating" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maxim rating conditions for extended periods may affect device reliability.

Para	meter	Rating	Unit
LEDN		100	V
VC		-0.3 to 6	V

### **Block Diagram**

### **Function Description**

DIO8241F is designed for driving one LED string and removing the 100/120Hz LED current ripple.

#### **Theory of Operation**

The LED string and DIO8241F are both supplied by an AC/DC current source. The drain of internal NMOSFET is connected to the cathode of LED string. A sensing resistor Rcs is connected between the source of NMOSFET and GND. DIO8241F drives NMOSFET to transfer the LED current ripple to voltage ripple on NMOSFET, and ensures the constant voltage across LED string and the constant current flow through LED string. The scalable adaptive function of DIO8241F can regulate the cathode voltage of LED string to minimum to improve the efficiency of the system.

#### **Current Ripple Removing**

The capacitor C<sub>C</sub> between VC and GND is an integral capacitor. DIO8241F transform the voltage on Cc to a reference voltage. The current regulator regulates LED current via negative feedback control.

 $C_{\text{C}}$  should be large enough in order to remove the current ripple of the LED string. However, too large capacitor may slow down the dynamic response.

#### **Adaptive Regulation**

DIO8241F controlsthe voltage on  $C_C$  by monitoring the operation state of built-in N-MOSFET. The efficiency of system is relatively low when N-MOSFET always works in the saturation region. DIO8241F detects it and charges  $C_C$  to raise the  $V_{VC}$  and  $I_{LED}$ , then the output voltage of power supply is reduced, and the voltage drop on N-MOSFET decreases.

Conversely, when N-MOSFET is working in the linear region, LED current regulation loop is open. DIO8241F detects it and discharges  $C_C$  to reduce the  $V_{VC}$  and  $I_{LED}$ , then the output voltage of power supply is raised, and the LED current regulation loop is closed.

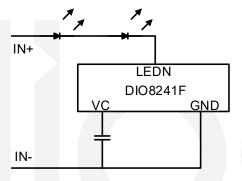

#### **PCB Design Guideline**

- 1. DIO8241F should be placed far away from the power devices for better thermal performance.
- 2. The area of LED current loop should be as small as possible.

### **Application Information**

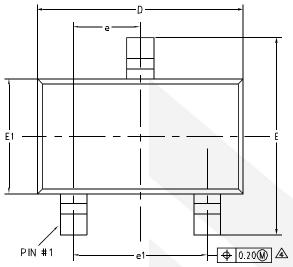

DIO8241F design guide:

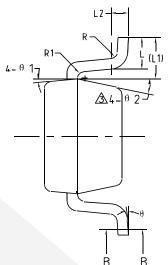

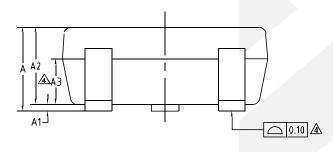

1. The value of the capacitor between VC and GND can determine the final amplitude of the current ripple. It should be large enough in order to remove the current ripple of the LED string. However, too large capacitor may low down the dynamic response.
