horizontal serrations. When you grasp and turn a screw head with ordinary pliers, the jaws slip and the screw remains stuck.

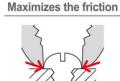

Ordinary plier jaws are lined with The tips of jaws can not reach the outer edge of screw head when the jaws are opened.

Vertical serrations

Both vertical and horizontal serrations grasp a screw head with no slip.

Specially-designed teeth generate gripping power.

The serrated jaws angled inward grab the rim of screw head, so no slippage.

■How to select the proper dies for crimping an open-barrel contact

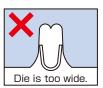

- 1. Measure the width of conductor barrel with a caliper while both barrel wings are in parallel.
- ON/OF ZERO

2. Select the die width which is close to the width of barrel wings measured.

For example: 1.5mm measured → Select 1.6mm dies.

^{**} If the length of barrel is longer than or smaller than the thickness of dies, crimping may be failed.
You are requested to refer to Contact Pin Application Chart first on our website (PA-09, PA-20, PA-21 & PAR-20)

Both vertical and horizontal serrations grasp a screw head with no slip.

1. Vertical serration

Case of ordinary pliers

Ordinary plier jaws are lined with horizontal serrations. When you grasp and turn a screw head with ordinary pliers, the jaws slip and the screw remains stuck.

Screw

Neji-saurus' speciallydesigned jaws generate gripping power.

2. Maximizes the friction

Neji-saurus' perfectlyfit serration maximizes the friction with no slip.
