Q. How do Screw Removal Pliers work?

A. Both vertical and horizontal serrations grasp a screw head with no slip.

Ordinary Pliers		Vertical serrations	Maximizes the friction
			
Ordinary plier jaws are lined with horizontal serrations. When you grasp and turn a screw head with ordinary pliers, the jaws slip and the screw remains stuck.	The tips of jaws can not reach the outer edge of screw head when the jaws are opened.	Specially-designed teeth generate gripping power.	The serrated jaws angled inward grab the rim of screw head, so no slippage.

■How to select the proper dies for crimping an open-barrel contact

1. Measure the width of conductor barrel with a caliper while both barrel wings are in parallel.

2. Select the die width which is close to the width of barrel wings measured.

For example: 1.5mm measured → Select 1.6mm dies.

※ If the length of barrel is longer than or smaller than the thickness of dies, crimping may be failed.

Advanced design of Vertical and Horizontal serrations

Q. How does Neji-saurus work?
A. Both vertical and horizontal serrations grasp a screw head with no slip.

Case of ordinary pliers

Ordinary plier jaws are lined with horizontal serrations. When you grasp and turn a screw head with ordinary pliers, the jaws slip and the screw remains stuck.

1. Vertical serration

Neji-saurus' specially-designed jaws generate gripping power.

2. Maximizes the friction

Neji-saurus' perfectly-fit serration maximizes the friction with no slip.

* The tool may not remove specially-hardened, heat-treated or glued screws.
 * Be sure to apply this tool to a screw head, but not to screw thread.
