# FilterCap MKD AC - Three phases

# Construction and general data

General data	
Dielectric	Metallized polypropylene film
Resin filling	Non PCB, soft polyurethane
Safety device	Overpressure disconnector, self-healing technology
Mounting and grounding	Stud on bottom of aluminum can
Cooling	Naturally air-cooled (or forced air cooling)
Degree of protection	Indoor mounting IP20 (IP54 upon request)
Discharge resistor	Upon request
Reference standards	IEC 61071, GB/T 17702, optional IEC 60831, UL 810
Safety approvals	For B32377 type A, and B32378 type A series: UL 810, CSA C22.2, No 190, Max.600 V <sub>RMS</sub> (Line voltage), 50/60 Hz, "Protected", 10 k AFC, Max. 70 °C.
	For B32377 type B, and B32377 type C series: UL 810, CSA C22.2, No 190, Max.1000 V <sub>RMS</sub> (Line voltage), 50/60 Hz, "Protected", 10 k AFC, Max. 70 °C.
	File no.: E487229, CCN:CYWT2/8
Terminals	B32377 Type A, Type B and B32378: M5 screw clamp terminals B32377 Type C: M6 screw clamp terminals

B3237X Series

## General purpose applications

# FilterCap MKD AC - Three phases

Mechanical characteristics	
Terminal cross section	B32377 Type A, B32377 Type B and B32378: 25 mm <sup>2</sup>
	B32377 Type C: 35 mm <sup>2</sup>
Max. torque (case)	M12: 12 Nm
Max. torque (for screw terminal)	B32377 Type A, B32377 Type B and B32378: 2 Nm B32377 type C: 3.5 Nm

<sup>\*</sup> Note that this life expectancy occurs for the worst case with a maximum temperature hot-spot of +85° Celsius degree. For other operation temperatures please check the life time curve for further details.

<sup>\*\*\*\*:</sup>Ths- Maximum temperature allowed at the capacitors hot spot. Considering mounting position with terminals to the top. For other mounting positions, please request evaluation.

Design data							
Dimensions (D x H)	According to specification table						
Weight approx.	According to specification table						
Max. terminal current	Screw clamp terminal: 50 A (B32377 type A) 80 A (B32377 type B) 100 A (B32377 type C) 50 A (B32378)						

#### Electrical characteristics: Clearance and creepage distances

Series	Diameter	Terminal to termin	al	Terminal to	case
	Mm	Min. clearance mm	Min. creepage mm	Min. clearance mm	Min. creepage mm
B32377 Type A	75/85/96/116/136	Not applicable	12.7	9.5	12.7
B32377 Type B	96/116/136	Not applicable	12.7	9.5	12.7
B32377 Type C	116/136	Not applicable	19.1	19.1	19.1
B32378 Type D	116/136	Not applicable	12.7	9.5	12.7
B32378 Type E	116/136	Not applicable	19.1	19.1	19.1

<sup>\*\*:</sup>T<sub>stg</sub> – Storage temperature.

<sup>\*\*\*:</sup>T<sub>max</sub>- Maximum operation ambient temperature.

#### FilterCap MKD AC – Three phases

## Capacitor catalog number (type or series designation)

F	FilterCap MKD AC series		Α	В	С	[	)	Е	F	G	Н	I		
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
В	3	2	3	7	7	Α	3	4	0	7	J	0	3	0

#### A. Indicates termination type

6 = M10 (3x) Screw terminals (delta connection)

7 = M5 (3x) Clamp terminals (type A and B, delta connection)

7 = M6 (3x) Clamp terminals (type C, delta connection)

8 = M5 (4x) Clamp terminals (star connection)

B. Indicates revision status (any letter), in case of S letter it means customized design

C. Indicates first number of voltage V<sub>RMS</sub> value (any digit)

D. Indicates first and second figure of capacitance value (any two digits)

±5%

44 Z 2018

E. Indicates exponent used as multiplier (any digit)

F. Indicates capacitor tolerance for PEC AC capacitor

 $J = \pm 5 \%$ ;  $K = \pm 10 \%$ ;

G. Indicates coded capacitance value

H. Indicates second number of voltage V<sub>RMS</sub> value (any digit)

I. Indicates Accessories (any digit)

530V~ U<sub>RMS</sub>  $U_N$ 750V~ Is 2.6kA IEC 61071 50/60Hz - 40...+70°C No PCB Overpressure disconnector Protected 10K AFC UL File E487229 Maximum torque of terminals (A): 2Nm

Discharge capacitor before handling

Label information Date code explanation

**WW Z YYYY** 

**WW** Z YYYY: production weeks (e.g.: 49) WW **Z** YYYY: produced in Zhuhai (China) WW Z YYYY: production year (e.g.: 2018)

#### Bar code explanation

Bar code consists of batch number and serial number.

Batch number: 9 digits (e.g.: 123456789)

Serial number: 3 digits (e.g.: 001)

#### Terminal type explanation

Terminals (A): type A terminals Terminals (B): type B terminals Terminals (C): type C terminals Terminals (D): type D terminals Terminals (E): type E terminals

FilterCap MKD AC - Three phases

#### Installation space requirements

- 1) A minimum distance of 20 mm between the capacitors is necessary to maintain sufficient cooling.
- 2) Keep at least 20 mm space above the capacitor and do not attach any mounting components at the crimp or on top. This gap will allow a longitudinal extension of the can in order to ensure that the overpressure disconnector can fully extend.

Figure 7: Installation space requirements

Note: For further details, please check installation manual for MKD-AC capacitors.

**Remark:** just for the series B32378 star connection applies the formula for transformation of voltage line-neutral to line to line. The conversion relationship is defined as (line to line voltage)  $V_{ll} = \sqrt{3} \cdot V_{ln}$  (phase voltage, line-neutral).

#### Display of ordering codes for TDK Electronics products

The ordering code for one and the same product can be represented differently in data sheets, data books, other publications, on the company website, or in order-related documents such as shipping notes, order confirmations and product labels. The varying representations of the ordering codes are due to different processes employed and do not affect the specifications of the respective products. Detailed information can be found on the Internet under www.tdk-electronics.tdk.com/orderingcodes.

FilterCap MKD AC - Three phases

#### **Terms**

#### Design

The winding element of the MKD capacitor consists of metallized polypropylene film. This winding construction achieves low losses and a high pulse-current withstand capability. Soft PU resin is used for impregnation of the capacitor.

#### Contacting

The end faces of the windings are contacted by metal spraying to ensure a reliable and low-inductance connection between the leads and layers. The leads are welded or soldered to these end faces, brought out through insulating elements (plastic) and soldered to the terminals.

#### **Impregnation**

All hollows between the windings and between the windings and the case are filled with an impregnating agent. Besides increasing dielectric strength, this improves heat dissipation from inside a capacitor. The impregnating agents that we use are free of PCB and halogens.

#### Self-healing

All MKD capacitors are self-healing, i. e. voltage breakdowns heal in a matter of microseconds and hence do not produce a short circuit.

Breakdowns can occur under heavy electrical load as a result of weaknesses or pores in the dielectric. The integrity of self-healing capacitors is not affected by such breakdowns.

- 1. Dielectric (Polypropylene)
- 2. Metallization
- 3. Material-displacing shock wave
- 4. Air gap with metal vapor
- 5,6. Plasma zone

7. Boundary layer between gas-phase dielectric and plasma zones

- 8. Puncture channel
- 9. Gas-phase dielectric
- 10. Zone of displaced metallization and dielectric

Figure 8: Description of Self-healing technology

## General purpose applications

FilterCap MKD AC - Three phases

When a breakdown occurs, the dielectric in a breakdown channel is broken down into its atomic components by the electric arc that forms between the electrodes. At the high temperatures of as much as 6000 K, a plasma is created that explodes out of the channel region and pushes the dielectric layers apart. The actual self-healing process starts with the continuation of the electric arc in the propagating plasma. Here the metal layers are removed from the metal edges by evaporation. Insulation areas are formed. The rapid expansion of the plasma beyond the areas of insulation and its cooling in the areas of less field strength allow the discharge to extinguish after a few microseconds.

The area of insulation that is created is highly resistive and voltage-proof for all operating requirements of the capacitor. The self-healing breakdown is limited in current and so it does not represent a short circuit. The self-healing process is so brief and low in energy that the capacitor also remains fully functional during the breakdown.

#### **Characteristics**

#### Equivalent circuit diagram

Any real capacitor can be modelled by the following schematic:

Figure 9: Equivalent circuit diagram

Symbol	Description	Unit
Ls	Series inductance	Н
Rs	Series resistance, due to contacts(leads, sprayed metal and film metallization	Ω
Rp	Parallel resistance, due to insulation resistance	Ω
С	Capacitance	F

C, R<sub>S</sub> and L<sub>S</sub> are magnitudes that vary in the frequency domain (AC).

R<sub>P</sub> is a magnitude defined in DC (insulation resistance).

#### Rated capacitance C<sub>R</sub>

It is referred to a test temperature of +20 °C and a measuring frequency range of 50 Hz to 1 kHz.

## Capacitance tolerance range

It is the range within which the actual capacitance may differ from rated capacitance. The actual capacitance is to be measured at a temperature of  $\pm 20$  °C. This range results from variances in materials and manufacturing processes. The standard manufacturing tolerance for PP film capacitors is  $\pm 10\%$  or 'K' tolerance or  $\pm 5\%$ , 'J' tolerance.

FilterCap MKD AC - Three phases

#### Temperature dependence of capacitance

The capacitance variation in the permissible temperature range is not linear, but it is reversible, the characteristic change in capacitance  $\Delta C/C$  as a function of test temperature is shown as follows:

Figure 10: Temperature dependence of capacitance

#### Capacitance drift

Capacitance is subject to irreversible in addition to reversible changes, i.e. capacitance drift, the sum of all time-dependent, irreversible changes of capacitance during operating life. This variation is stated in percent of the value at delivery. The typical figure is +1/-3%.

## Rated AC voltage V<sub>R</sub>

The maximum operating peak recurrent voltage of either polarity of a reversing type waveform for which the capacitor has been designed.

Unlike what is common in other standard (e.g. B32304\* 3–phase capacitor series for PFC application) therefore, the rated voltage  $V_R$  is not the RMS value, but the maximum or peak value of the capacitor voltage. The voltage at which the capacitor may be operated is dependent on other factors (especially current and frequency) besides rated voltage.

#### Voltage V<sub>RMS</sub>

It is the Root Mean Square (RMS) voltage of maximum permissible value of sinusoidal AC voltage in continuous operation.

Figure 11: Voltage V<sub>RMS</sub>

## General purpose applications

# FilterCap MKD AC - Three phases

#### Rated DC voltage V<sub>RDC</sub>

It is the maximum operating peak voltage of either polarity but of non-reversing type waveform, for which the capacitor has been designed, for continuous operation.

## Non-recurrent surge voltage Vs

A peak voltage induced by a switching or any other disturbance of the system which is allowed for a limited number of times and for durations shorter than the basic period.

Figure 12: Non-recurrent surge voltage V<sub>S</sub>

Maximum duration: 50 ms/pulse

Maximum number of occurrences: 1000 (during load)

## Max. Recurrent peak voltage û

This is the permissible, max. recurrent peak voltage that may appear for max.1% of the period.

Figure 13: Max. Recurrent peak voltage û

# Symmetric alternating voltage $\hat{\mathbf{u}}_{ac}$

The peak values of a symmetrical alternating voltage applied to the capacitor is a decisive factor for the dielectric losses.

For AC capacitors:  $\hat{u}_{ac} = V_R$ 

## Insulation voltage Vi

It is the rms rated value of the insulation voltage of capacitive elements and terminals to case or earth. If not specified, the rms value of the insulating voltage is equivalent to the rated voltage divided by  $\sqrt{2}$ .

#### Maximum current I<sub>max</sub>

It is the maximum rms current for continuous operation, but could not be higher than maximum terminal current. A higher current than proposal  $I_{\text{max}}$  value could be possible in lower ambient temperature.

# FilterCap MKD AC - Three phases

#### Maximum peak current Î

It is the maximum current amplitude which occurs instantaneously during continuous operation. The maximum peak current and the maximum rate of voltage rise  $(dV/dt)_{max}$  on a capacitor are related as follows:

$$\hat{\mathbf{I}} = \mathbf{C}_{\mathbf{R}} \cdot \left(\frac{\mathrm{d}\mathbf{V}}{\mathrm{d}\mathbf{t}}\right)_{\mathrm{max}}$$

#### Maximum surge current I<sub>s</sub>

It is the peak non-repetitive current induced by switching or any other disturbance of the system permitted for a limited number of times, at durations shorter than the basic period.

$$I_{s} = C_{R} \cdot \left(\frac{dV}{dt}\right)_{s}$$

Maximum duration: 50 ms/pulse

Maximum number of occurrences: 1000 (during load)

#### Self-inductance L<sub>self</sub>

The self-inductance is produced by the inductance of the terminals and the windings. Because of the special kind of contacting in self-healing capacitors (large area metal spraying covering all windings), the self-inductance is particularly low. It allows the resonance frequency to be determined:

$$f = \frac{1}{2\pi\sqrt{L_{self} \cdot C_R}}$$

The resonance frequency is high for all capacitors accordingly.

#### Insulation Resistance (Rins)

The dielectric of a capacitor has a large area and a short length. Even if the material is a good isolator there always flows a certain current between the charged electrodes (the current increases exponentially with the temperature). This leakage can be described as a parallel resistance with a high value, an Insulation Resistance.

Figure 14: Insulation Resistance (Rins)

# FilterCap MKD AC - Three phases

#### Insulation resistance and self-discharge time constant

The insulation values for the individual components according to the capacitance are stated as an insulation resistance  $R_{ins}$  in  $M\Omega$  or a self-discharge time constant  $\tau$  in seconds.

$$\tau = R_{ins} \cdot C_R$$

#### Series resistance Rs

Resistive losses occur in the electrodes in the contacting and in the inner wiring. These are comprised in the series resistance R<sub>S</sub> of a capacitor.

The series resistance  $R_S$  generates the ohmic losses ( $I^2 \times R_S$ ) in a capacitor. It is largely independent of frequency. The figures stated in selection charts apply to  $+20^{\circ}\text{C}$  capacitor temperature.

#### Dissipation factor tan $\delta$

The equivalent circuit diagram used for the losses in a capacitor can be shown as follows:

Figure 15: Simplified equivalent circuit diagram of a capacitor

Symbol	Description	Unit
С	Capacitor	F
L <sub>self</sub>	Self-inductance	Н
ESR	Equivalent series resistance, representing the entire active power in capacitor	Ω

The self-inductance and capacitance of a capacitor produce its resonance frequency (natural frequency).

$$\tan \delta(f) = \tan \delta_0 + Rs \cdot \omega \cdot C$$

From the frequency dependence of the equivalent series resistance can be derived:

$$ESR = \frac{\tan \delta}{\omega \cdot C} = Rs + \frac{\tan \delta_0}{\omega \cdot C}$$

Symbol	Description	Unit
tan δ	Dissipation factor of capacitor	-
tan δ <sub>0</sub>	Dissipation factor of dielectric	-
Rs	Series resistance	Ω

#### Dielectric dissipation factor tan $\delta_0$

The dissipation factor  $tan \delta_0$  of the dielectric is assumed to be constant for all capacitors in their frequency range of use. The figures stated in data sheets apply to rated operation.

#### Expected Fit rate λ

The FIT (Failure In Time) of a component is defined as the number of expected failures in 10<sup>9</sup> hours of operation.

The FIT rate is calculated on the basis of the number of components operating in the field and the estimated hours of operation. All the reports of failures are taken into consideration for this calculation, which is updated every year. The other values in the graph are given as indication and calculated based on acceleration factors.

The failure criterion is capacitance drop higher than 3%.

Figure 16: Expected Fit rate λ

#### Thermal design

In order to scale a capacitor correctly for a particular application, the permissible ambient temperature has to be determined. This can be taken from the diagram "Permissible ambient temperature TA vs total power dissipation P" after calculating the power dissipation (for further details please check individual data sheets).

# FilterCap MKD AC - Three phases

#### Calculation of power dissipation P

The total power dissipation P is composed of the dielectric losses ( $P_D$ ) and the resistive losses ( $P_R$ ). Generally a secondary sinusoidal AC voltage can be used for calculating with sufficient accuracy.

$$\begin{aligned} P &= P_D + P_R \\ P_D &= \hat{u}_{ac}^2 \cdot \pi \cdot f_0 \cdot C \cdot \tan \delta_0 \end{aligned}$$

Symbol	Description	Unit
û <sub>ac</sub>	Peak value of symmetrical AC voltage applied to capacitor	V
$f_0$	Fundamental frequency	Hz
С	Capacitance	F
tan $\delta_0$	Dissipation factor of dielectric	-

$$P_R = I^2 \cdot R_S$$

Symbol	Description	Unit
I	RMS value of capacitor current	Α
Rs	Series resistance at maximum hot-spot temperature	Ω

The R<sub>S</sub> figure at maximum hot-spot temperature is used to calculate the resistive losses. In selection charts and data sheets the figure is stated for 20 °C capacitor temperature. The conversion factor is as follows:

$$R_{s85^{\circ}} = 1.25 \cdot R_{s20^{\circ}}$$

#### Thermal resistance Rth

The thermal resistance is defined as the ratio of a temperature difference and the power dissipation produced in a capacitor. The decisive factor here is  $\Delta T$ cap where the temperature difference between an external reference point of the coolant (e.g. air) surrounding the capacitor and the hot spot (zone with highest temperature occurring in the component). In a steady state:

$$R_{th} = \frac{\Delta T_{cap}}{P}$$

Symbol	Description	Unit
R <sub>th</sub>	Thermal resistance	K/W
ΔТсар	Temperature difference between hot-spot and ambient	K
Р	Power dissipation	W

## General purpose applications

# FilterCap MKD AC - Three phases

The temperature difference depends on a large number of different factors. The thermal resistance is a function of several parameters such as the working temperature and the power dissipation of the capacitor.

After installation of the capacitor, it is necessary to verify that maximum hot-spot temperature is not exceeded at extreme service conditions. For detail calculations please refer to single datasheet part number for further details.

#### Life expectancy t<sub>LD</sub>

The life expectancy  $t_{LD}$  is based on the exclusive effect of Voltage and Temperature (hot-spot  $T_{hs}$ ) applied to the capacitor dielectric and electrodes (other factors are not considered in the model such as environmental or mechanical effects).

Hot Spot Temperature ( $T_{hs}$ ): as the sum of ambient temperature plus the heating induced by the current ( $I_{RMS}$ ) in the dielectric which is measured inside of capacitor. Current is an indirect parameter under consideration which affects the temperature  $T_{hs}$ .

Lifetime estimation formula as follows:

$$t_2 = t_1 \cdot e^{(T_1 - T_2)/A} \left(\frac{V_1}{V_2}\right)^n$$

Symbol	Description	Unit
t <sub>2</sub>	Estimated lifetime at temperature T <sub>2</sub> and Voltage V <sub>2</sub>	hour
$t_1$	Reference life expectancy (e.g. 100,000 hours for V <sub>R</sub>  ΔC/C ≤3%)	hour
$V_2$	Variable Voltage (Rated AC voltage)	VAC
V <sub>1</sub>	Reference Voltage (Rated AC voltage)	VAC
T <sub>1</sub>	Reference temperature (e.g. 70°C)	℃
T <sub>2</sub>	Variable temperature	℃
Α	Acceleration factor of temperature	-
n	Acceleration factor of voltage	-

FilterCap MKD AC - Three phases

#### **Lifetime Expectancy Graphs**

The lifetime estimations below shows the standard expected lifetime of 100,000 hours (at +85 °C hotspot) are only theoretical calculations based on endurance test results performed according to IEC61071 standard.

**Figure 17:** Service life t<sub>LD</sub> at different hot-spot temperature (T<sub>hs</sub>) and voltage V<sub>RMS</sub>.

#### Film Capacitors - Power Electronic Capacitors

**B3237X Series** 

#### General purpose applications

FilterCap MKD AC - Three phases

## **Cautions and warnings**

- Capacitors with dents of more than 1 mm depth or any other mechanical damage must not be used.
- Check the tightness of the connections / terminals periodically.
- The energy stored in capacitors may be lethal. To prevent any risk of shock, the capacitors must be discharged and short-circuited before handling.
- Failure to follow cautions may result in the worst case in premature failure, bursting and fire.

#### Safety

- Electrical or mechanical misapplication of capacitors may be hazardous. Personal injury or property damage may result from bursting of the capacitor or expulsion of molten material due to mechanical disruption of the capacitor.
- Ensure good, effective grounding for capacitor enclosures.
- Observe appropriate safety precautions during operation (self-recharging phenomena and the high energy stored in capacitors).
- Handle capacitors carefully, as they may still be charged even after disconnection.
- The terminals of capacitors, connected busbars and cables as well as other devices may also be energized.
- Follow good engineering practice.
- The maximum permissible fault current (AFC) of 10 kA in accordance with the UL 810 standard must be assured by the application.

#### Thermal load

After installing the capacitor, verify that the maximum hot-spot temperature is not exceeded under extreme operating conditions.

#### **Mechanical protection**

The capacitor has to be installed to assure that no mechanical damage or dents in the case occur.

#### Storage and operating conditions

Do not use or store capacitors in corrosive atmospheres, especially where chloride gas, sulfide gas, acid, alkali, salt or the like are present. In dusty environments, regular maintenance and cleaning, especially of the terminals, is required to avoid creating a conductive path between phases and/or phases and ground.

#### Overpressure disconnector

- To ensure full functionality of an overpressure safety disconnector, the following points must be observed:
  - 1. The elastic elements must not be hindered, i.e.
    - Connecting lines must be flexible leads (cables)
    - There must be sufficient space (min.15 mm) for expansion above the connections
    - The metal cover must not be retained by rigid parts such as busbars.
  - 2. The stress parameters of the capacitor must be within the IEC 61071 specification.

#### Service life expectancy

Electrical components do not have an unlimited service life expectancy: this also applies to self-healing capacitors. The maximum service life expectancy may vary depending on the application in which the capacitor is used.

#### Important notes

The following applies to all products named in this publication:

- 1. Some parts of this publication contain statements about the suitability of our products for certain areas of application. These statements are based on our knowledge of typical requirements that are often placed on our products in the areas of application concerned. We nevertheless expressly point out that such statements cannot be regarded as binding statements about the suitability of our products for a particular customer application. As a rule we are either unfamiliar with individual customer applications or less familiar with them than the customers themselves. For these reasons, it is always ultimately incumbent on the customer to check and decide whether a product with the properties described in the product specification is suitable for use in a particular customer application.
- 2. We also point out that in individual cases, a malfunction of electronic components or failure before the end of their usual service life cannot be completely ruled out in the current state of the art, even if they are operated as specified. In customer applications requiring a very high level of operational safety and especially in customer applications in which the malfunction or failure of an electronic component could endanger human life or health (e.g. in accident prevention or life-saving systems), it must therefore be ensured by means of suitable design of the customer application or other action taken by the customer (e.g. installation of protective circuitry or redundancy) that no injury or damage is sustained by third parties in the event of malfunction or failure of an electronic component.
- 3. The warnings, cautions and product-specific notes must be observed.
- 4. In order to satisfy certain technical requirements, some of the products described in this publication may contain substances subject to restrictions in certain jurisdictions (e.g. because they are classed as hazardous). Useful information on this will be found in our Material Data Sheets on the Internet (www.tdk-electronics.tdk.com/material). Should you have any more detailed questions, please contact our sales offices.
- 5. We constantly strive to improve our products. Consequently, **the products described in this publication may change from time to time**. The same is true of the corresponding product specifications. Please check therefore to what extent product descriptions and specifications contained in this publication are still applicable before or when you place an order.
  - We also **reserve the right to discontinue production and delivery of products**. Consequently, we cannot guarantee that all products named in this publication will always be available. The aforementioned does not apply in the case of individual agreements deviating from the foregoing for customer-specific products.
- 6. Unless otherwise agreed in individual contracts, all orders are subject to our General Terms and Conditions of Supply.
- 7. Our manufacturing sites serving the automotive business apply the IATF 16949 standard. The IATF certifications confirm our compliance with requirements regarding the quality management system in the automotive industry. Referring to customer requirements and customer specific requirements ("CSR") TDK always has and will continue to have the policy of respecting individual agreements. Even if IATF 16949 may appear to support the acceptance of unilateral requirements, we hereby like to emphasize that only requirements mutually agreed upon can and will be implemented in our Quality Management System. For clarification purposes we like to point out that obligations from IATF 16949 shall only become legally binding if individually agreed upon.

## Important notes

8. The trade names EPCOS, CeraCharge, CeraDiode, CeraLink, CeraPad, CeraPlas, CSMP, CTVS, DeltaCap, DigiSiMic, ExoCore, FilterCap, FormFit, LeaXield, MiniBlue, MiniCell, MKD, MKK, MotorCap, PCC, PhaseCap, PhaseCube, PhaseMod, PhiCap, PowerHap, PQSine, PQvar, SIFERRIT, SIFI, SIKOREL, SilverCap, SIMDAD, SiMic, SIMID, SineFormer, SIOV, ThermoFuse, WindCap are **trademarks registered or pending** in Europe and in other countries. Further information will be found on the Internet at www.tdk-electronics.tdk.com/trademarks.
