5. Function Description

5.1 Typical Application System

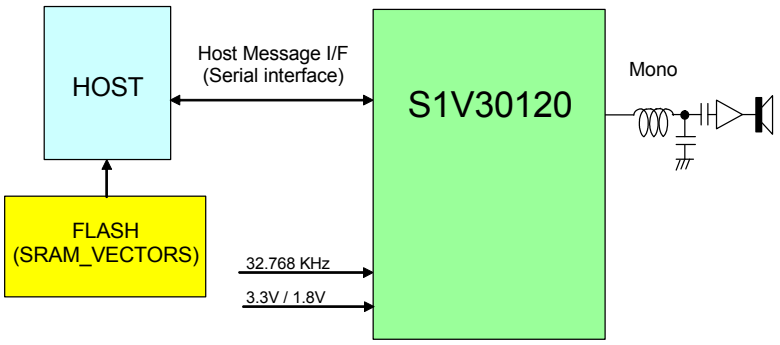

Fig. 5-1 Standard Application system

Fig. 5-1 illustrates a typical application system using the S1V30120. The host processor communicates with the S1V30120 over the serial interface, using commands (message protocol) to control the embedded algorithms. For more information on commands, see "S1V30120 Message Protocol Specification."

On reset the S1V30120 runs the bootstrap loader firmware. The host must then use bootstrap loader messages to load the SRAM firmware contents and ROM firmware updates (SRAM_VECTORS) into the S1V30120 device's SRAM and to switch to running the main mode. These SRAM_VECTORS are stored in FLASH in the typical application system shown in Fig. 5-1 above.

Refer to section 4 of the S1V30120 message protocol specification for details of the bootstrap loader messages and section 5 for details of the the main mode messages.

Take the following sequences for powering on or off the IC:

(When AVDD=1.8V)

Power on: LVDD/PLLVDD/AVDD => HVDD
Power off: HVDD => LVDD/PLLVDD/AVDD

(When AVDD=3.3V)

Power on: LVDD/PLLVDD => HVDD/AVDD
Power off: HVDD/AVDD => LVDD/PLLVDD

Notes:

– Do not apply voltage only to HVDD longer than a second with LVDD, PLLVDD and AVDD turned off, or the product reliability may be harmed.

– When returning HVDD from the off-state to the on-state, the state of the internal circuit is not guaranteed due to power supply noise, etc. Therefore, be sure to initialize the circuit by NRESET after the IC power-up.
