[7] Typical Performance Characteristics (For reference only)

The following data shows typical performance characteristics

(7-1) Frequency / Temperature Characteristics

 $f_0 = 25 \text{ MHz}, \pm 25 \times 10^{-6}$ at -20 to $+70 \text{ }^\circ\text{C}$

n = 50 pcs

$f_o = 72\text{ MHz}$

* Output load condition under $L_{CMOS} > 15\text{ pF}$ (dotted line area) is not guaranteed, and the data is for reference.

The actual current consumption is the total of the current under the condition of no load and the current to drive the output load ($f_o \times L_{CMOS} \times V_{CC}$). To reduce the current consumption, it is effective to use lower frequency, lower supply voltage and lower output load.
