ERbic is a trademark of the ERNI Elektroapparate GmbH, Adelberg.

General Information

The development of bus systems for industrial applications began in 1983. To be more accurate, it was the use of serial data transmission which brought about the breakthrough. In 1988, field bus systems were still new in industrial automation and a great deal of effort was required to win customers. But within a very short time, so-called field bus systems have gained acceptance to an extent that no one could have dreamed of.

This has only been possible because customers have simply been made aware of a clear product advantage. From then on, it was no longer necessary to individually wire device for device and signal for signal; instead so-called "bus nodes" could be installed, which communicate with one another by means of a 2-wire cable and pass on commands to the input and output modules. In this way, installation expense and the possibility of faults were considerably reduced. Added to this are features such as remote diagnostics, parameter setting and modularity, to name but a few. Of the multitude of field buses that came onto the market, some have almost disappeared again. The large control system manufacturers are trying to establish their systems in the marketplace through so-called user organizations, e.g. PNO (Profibus User Organization), CiA (CAN in Automation), SafetyBUS p (SafetyBUS Club), and other marketing activities.

A fundamental difference is constituted by the different network topologies. Hence, there are line, ring or star configurations. All have their particular advantages and disadvantages. Device hierarchies are also possible: master-slave systems or multi-master systems.

A characteristic of the line configuration is that the bus must be "terminated" by means of a resistor at the end of the line in order to avoid effects such as reflections, which may interfere with the communication.

Devices within the line are cabled by "looping through". Here, the T function, which enables the bus to operate when the plug is removed, is of particular interest.

ERNI is currently concentrating on Profibus, CAN bus and SafetyBus p versions where, at the same time, customer-specific solutions e.g. for Bitbus, Interbus, etc. also exist. In the meantime, some bus systems have been internationally standardized. The so-called physical layer is also defined in these standards, which, among other things, specify the cable, the connectors and the contact assignment. There are still differences with regard to the protection class. Different plug connectors are recommended depending on this. The term "light duty" is used with IP 20 and "heavy duty" with IP 65/67.

ERNI bus interface connector, ERbic for short

The interface plugs of the ERbic line for various bus systems offer different features and advantages. They are based on D-Sub interface technology. All ERbics have compact external dimensions. There are versions with horizontal and vertical cable outlets.

Both pure node versions and pure termination versions are available as well as nodes with a connectable termination resistor. The node (without termination resistors) is used within the length of a line and the termination (with termination resistors) at the end of the line. The node with a connectable termination resistor can be used anywhere. The latter is simply configured as a termination by changing the position of the switch.

The housings of the pure terminations are a different color than the nodes. The end of the line is therefore immediately recognizable.

The bus systems are also different colors. The user can therefore easily find their way around within a system.

A T function is provided in all ERbics. A device can therefore be changed while the bus is running. The types with a connectable termination resistor are primarily suitable for customers with reduced storage or when setting up, extending or converting large systems.

Certain types are reversed with regard to the face of the connector, allowing the direction of the cable outlet to be determined. This is achieved by a special pin arrangement in the D-Sub connector.

However, the standard direction of the cable outlet is matched to the devices of the market leaders and should therefore be used for new designs.

A further outstanding feature is the termination technology. Depending upon the type, ERbics are available with screw terminals, cage-clamp terminals or IDC terminals.

Terminations using the Siemens FastConnect principle, for example, are therefore possible.

The development of field buses in the direction of safety-related applications is also satisfied by corresponding further advancement of the ERbic line. There is a Profibus Ex i version, which was developed together with ABB, or a SafetyBus p version for the Pilz company.

As an alternative to the plastic housing, the newly developed ERbic MAX has recently been introduced to the market. This has a metal housing and an axial cable outlet. It is particularly suitable for harsh environments and offers space advantages at the field device when several interfaces are present.

The metal housing guarantees optimum EMC.

Features

Common ERbic design for different bus systems. Versions for Profibus, CAN bus and SafetyBus p. Different colors among buses.

Node with connectable termination resistor

Integral T function, bus in, bus out

Support for max. data rates, e.g. Profibus, 12 Mbit/s through integral inductances

Pure nodes and termination versions. Color differentiation between node and termination within the bus

Flexibility through different termination technologies

Features

Full metal version for particularly severe loading

Reversed version for determining the cable outlet direction

Horizontal or vertical cable outlet

Versions with second D-Sub as service interface and externally connectable termination resistor

Reliable cable strain relief with shield connection

Special versions on request

Applications

Dimensional Drawings

ERbic MAX

ERbic Profibus

Profibus is the most widely used field bus. It is promoted by Siemens and by organized, interested and committed manufacturers and users in the PNO (Profibus user organization). The IP 20 interface on the device side is standardized as a 9-pin D-Sub female connector. The max. data transmission rate is 12 Mbit/s. The cable is a shielded twisted pair conductor.

The cable sheath is violet and the signal cores are green (A) and red (B).

With its comprehensive program, ERNI provides customers with a wide variety of options.

Particular emphasis should be placed on the different termination technologies, from the traditional screw terminal to the cage clamp terminal to the IDC terminal.*

ERbic Profibus Ex i

There is a special Profibus specification for safety-orientated intrinsically safe applications. Intrinsic safety is achieved by limiting the energy. At low voltage, this is reflected, among other things, by a higher current density in the bus line, as the devices are also supplied with power via the bus line. With regard to the connector, the main factor is compliance with EN 50020. For example, defined clearance and creepage distances and current carrying capacity must be taken into account. These Ex i connectors have been developed in cooperation with ABB and approved for their S900 controller. The individual connector alone does not require separate approval. This must always be given in conjunction with the system in accordance with the relevant directives and standards.

ERbic CAN Bus

The CAN bus, originally developed for automobile engine management, is distinguished by its particularly high reliability. Among other things, this necessitates a more complicated protocol, which leads to lower data rates and cable lengths. This can be compensated for in part by larger cable cross sections. Data rates reach 1 Mbit/s. The 9-pin D-Sub connector is standardized as the interface to the device. In some cases, a version with a shield coupling capacitor is available as an option (cable shield <-> housing D-Sub).

ERbic SafetyBUS p

The SafetyBUS p utilizes the advantages of the CAN bus. A protocol has been developed by Pilz that satisfies safety engineering requirements.

A larger cable cross section of 0.75 mm² is specified to cover longer distances. Only the 3 conductors necessary for the bus are terminated within the connector (HLG).
