

The SABRE® ES9081 High Performance Audio DAC is an 8-channel audio digital to analog converter (DAC) incorporating an integrated line driver that targets consumer and professional applications with integrated components to reduce system Bill-Of-Material (BOM) costs.

Using ESS' patented HyperStream® IV architecture and advanced SABRE HIFI® technology, the ES9081 delivers a True DNR +120dB DNR and –108dB THD+N per channel and provides the listener with the legendary SABRE® sound quality with improved audio performance and a refined and enjoyable listening experience.

The ES9081 incorporates:

- Digital Volume range from +1 to -126dB in 0.5dB steps with 0 to +42dB pre-gain in +6dB Steps
- 8 internal digital filters
- The integrated proprietary Analog PLL eliminates an external oscillator with no effect on performance.

With the integrated line drivers, the ES9081 reduces BOM costs by eliminating the need for external amplifiers to produce a line level 2V_{rms} output on each of the 8 channels. Channels can be summed to improve performance in an application requiring fewer channels. A 2-channel differential configuration can achieve up to +127dB DNR with a 4V_{RMS} output. A 4-channel sum configuration can achieve +123dB DNR with 2V_{rms} single-ended output.

The SABRE® DAC flexible input architecture accepts serial data up to a 768kHz sample rate (64FS mode) & DSD1024.

The ES9081 is drop-in compatible with the previous generation of ES9080 and allows customers to upgrade seamlessly and achieve higher performance with their current systems.

The ES9081 sets a new standard for high-quality audio performance in a cost-effective, compact, easy to use form factor for today's most demanding digital audio applications.

FEATURE	DESCRIPTION
+120dB DNR per channel -108dB THD+N per channel	Ultra-low noise and distortion
High Sample Rates	Support for sample rates up to and including 768kHz & DSD1024
8-channel DAC + 2Vrms Line Driver	The ground centered line driver reduces BOM costs w/o required external amplifier. Reduced footprint and simplifies board layout
Versatile Digital Audio Input Port	Supports Serial Data Interface inputs such as TDM, I ² S, LJ, DoP, and DSD formats.
S/PDIF Encoder	An S/PDIF encoder is integrated for format conversion
I ² C Control Interface	Standard I ² C interface for programming desired settings
Integrated Low Noise DAC Reference Regulators	Reduced BOM cost, PCB area and improved DNR
Customizable Filter Selection	8 preset digital filters
Low Pin Count Standardized Packages	5mm x 5mm, 40 pin QFN, drop-in compatible with ES9080* (See pinout)

APPLICATIONS

- Soundbar Applications
- Multi-Channel Live Stream Media
- Class-D Pre-Amplifier Controller & Integrated Amplifiers
- AVR Receivers & Gaming Motherboards

ES9081 Product Datasheet

Digital Features

I²C Slave Interface

The ES9081 supports a slave I²C interface. There are two types of registers, read/write registers and read-only registers.

A system clock is not required to read and write registers.

The default I²C Address is 0x90 and can be changed with Register 0[5:4] I2C_ADDR to any of: 0x90, 0x92, 0x94, 0x96

I²C Slave Interface Commands

- Connect per I²C standard
 - SDA_SLAVE (Pin 30)
 - SCL_SLAVE (Pin 29)

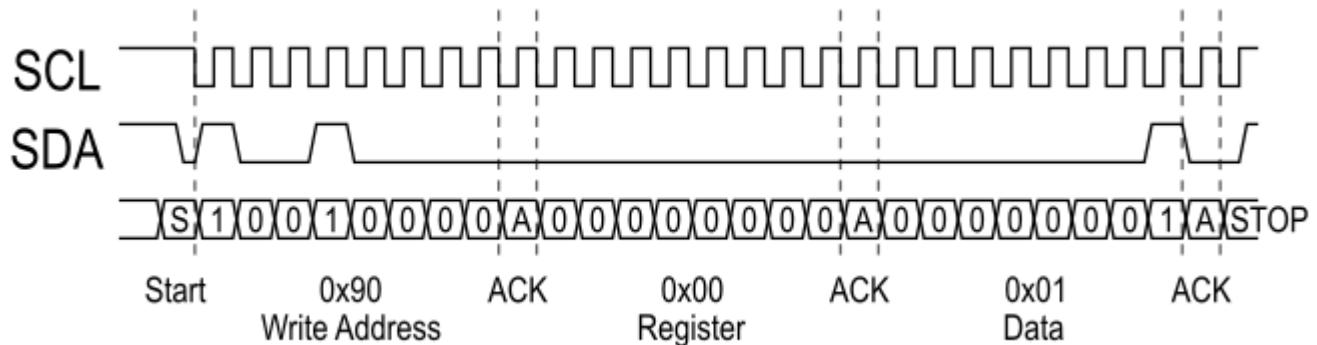

Figure 3 - I²C Write Example

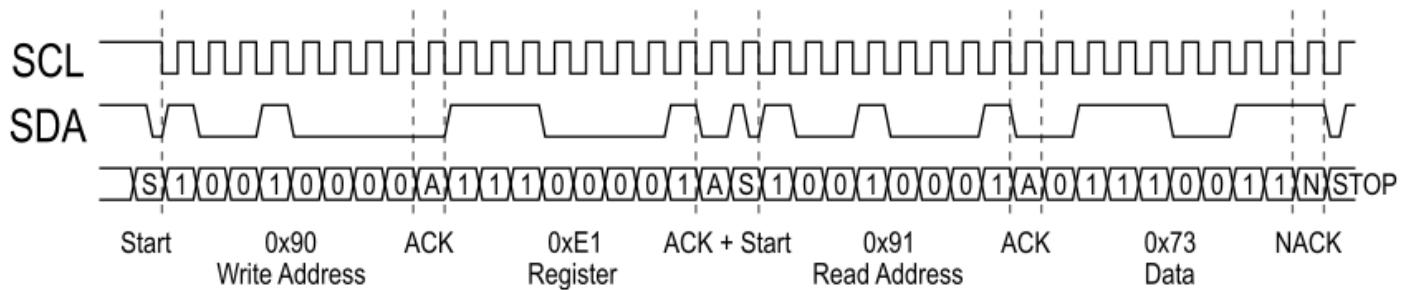

Figure 4 - I²C Read Example

Note: CHIP_ID is 0x73 in Register 225 (0xE1)

Audio Input/Output Formats

The ES9081 supports multiple serial input data formats selected via registers.

The ES9081 can automatically determine the input data format (PCM, DSD and DoP Only) by enabling Register 1[0] AUTO_INPUT_SEL, data must be provided on the DATA2 pin to properly decode the input format. The input data format can also be selected using Register 1[2:1] INPUT_SEL.

The formats include:

- PCM
 - Slave and master mode in 16, 24, 32 - bit widths
 - I²S and Left Justified (LJ)
 - Sample rates up to 768kHz (64fs mode)
 - Channel remapping & invert
- TDM
 - Up to 32 slots including daisy chain mode
 - I²S or LJ in Slave and master modes
 - Channel remapping & invert
- DoP (DSD Over PCM)
 - Slave and master mode
 - Sample rates from DoP256 (24bit, 705.5kHz PCM)
 - Channel mapping & invert
- DSD
 - Slave and master mode
 - Sample rates from DSD64 (2.8224Mbits/s, 64x44.1kHz) to DSD1024
 - Channel mapping & invert
- PDM
 - Slave and Master mode
 - Channel mapping & invert
- S/PDIF
 - Stereo 2 Channel output
 - Channel Select
 - Sample rates up to 192kHz

ES9081 Product Datasheet

PCM/TDM Decoder

The ES9081 integrates a PCM/TDM Decoder whose input has a maximum word width of 32-bits (default) and a maximum bit depth of 32-bit (default). The decoder allows for I²S, LJ, and TDM input streams.

The PCM/TDM decoder can support up to 32 different slots and each channel of the DAC can be mapped to any of the 32 slots.

PCM/TDM Decoder/Encoder Registers

- Register 6[7] TDM_RESYNC
- Register 6[6] AUTO_CH_DETECT
- Register 6[4:0] TDM_CH_NUM
- Register 7[7] ENABLE_WS_MONITOR
- Register 7[6] ENABLE_BCK_MONITOR
- Register 7[5:4] TDM_WORD_WIDTH
- Register 7[3:2] TDM_BIT_DEPTH
- Register 7[1] TDM_VALID_EDGE
- Register 7[0] TDM_LJ

PCM/TDM Decoder Mapping Registers

- Register 8-15[6:5] TDM_LINE_SEL_CHx
- Register 8-15[4:0] TDM_SLOT_SEL_CHx

Daisy Chain Registers

- Register 18[7] TDM_DAISY_CHAIN
- Register 18[6:5] TDM_DAISY_CHAIN_LINE_IN
- Register 18[4:0] TDM_DATA_LATCH_ADJ

PCM (I²S, LJ) Format

The input data is organized into 2 channels per data line, on up to 5 data lines. Each input data slot can be mapped to any DAC channel using Register 8-15[4:0] TDM_SLOT_SEL_CHx. Input data is latched on the positive edge of BCLK.

PCM Pin Connections:

Pin Name	Function	Description
DATA_CLK	PCM BCLK	PCM Clock (Bit Clock), Master or Slave
DATA1	PCM WS	PCM WS (Word Select/Frame Select), Master or Slave
DATA2	PCM DATA1	PCM Data Channel 1 & 2 (default)
DATA3	PCM DATA2	PCM Data Channel 3 & 4 (default)
DATA4	PCM DATA3	PCM Data Channel 5 & 6 (default)
DATA5	PCM DATA4	PCM Data Channel 7 & 8 (default)

Table 2 - PCM Pin Connections

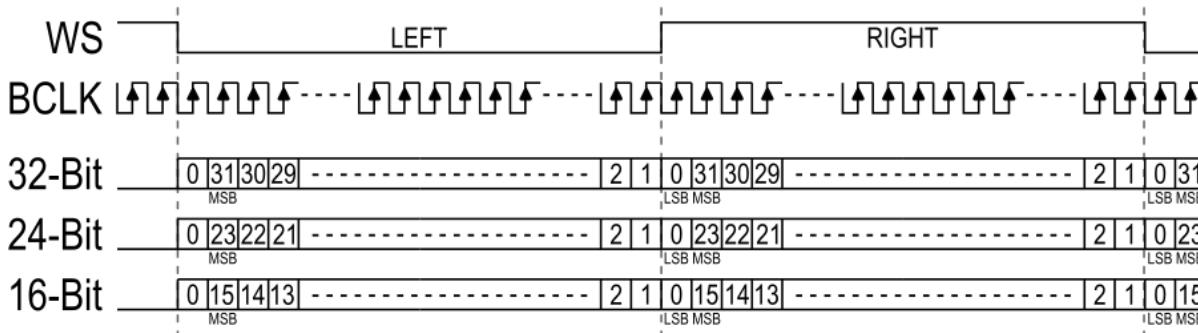

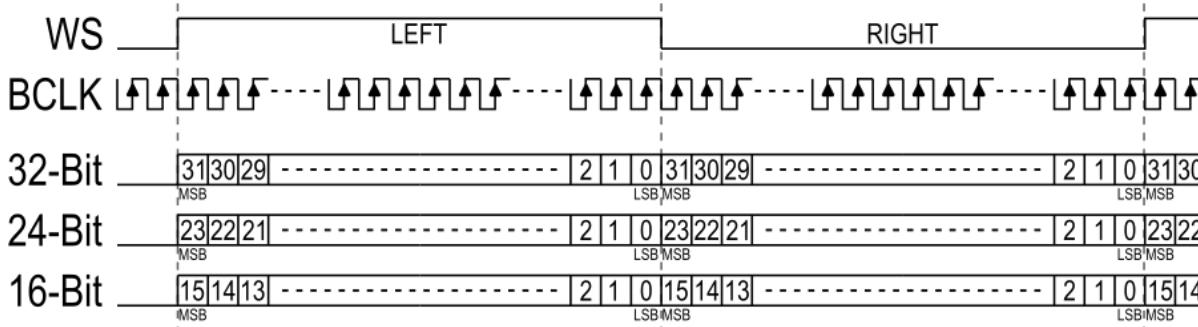

Figure 5 - LJ (top) & I²S (bottom) for 16,24, and 32-bit Word Widths

ES9081 Product Datasheet

TDM Format

The ES9081 supports TDM format, allowing for 2 to 32 channels on a single data line. The TDM data lines are to be input through DATA2-5. Input data is latched on the positive edge of BCLK.

Registers 8-15 [4:0] TDM_SLOT_SEL_CHx can be set to internally map any slot to any DAC channel.

TDM Pin Connections:

Pin Name	Function	Description
DATA_CLK	TDM BCLK	TDM Clock, Master, or Slave
DATA1	TDM WS	TDM WS (Word Select/Frame Select), Master or Slave
DATA2	TDM DATA1	TDM DATA Channel 1 & 2 (default)
DATA3	TDM DATA2	TDM DATA Channel 3 & 4 (default)
DATA4	TDM DATA3	TDM DATA Channel 5 & 6 (default)
DATA5	TDM DATA4	TDM DATA Channel 7 & 8 (default)

Table 3 - TDM Pin Connections

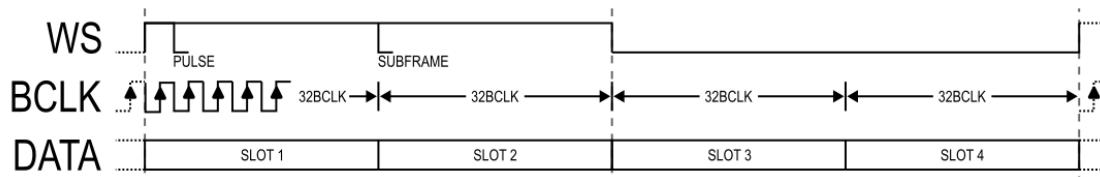

Figure 6 - TDM4 Mode

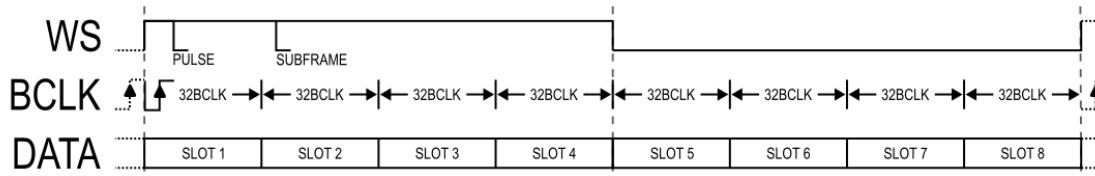

Figure 7 - TDM8 Mode

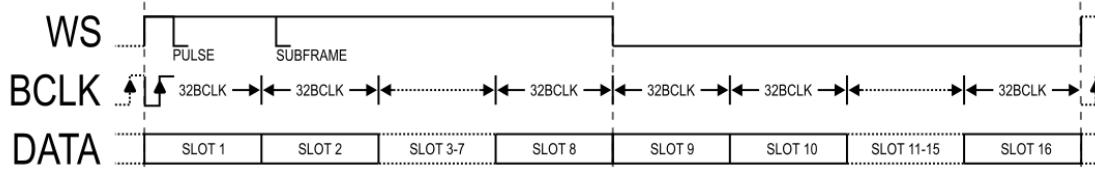

Figure 8 - TDM16 Mode

DSD Format

In DSD mode, there is a single DSD clock line, and each channel of data is an additional DSD data line. Each DSD source can be remapped to any DAC channel by using the below registers.

DSD Channel Mapping Registers

- Register 19-22[5:3][2:0] DSD_LINE_SEL_CHx

DSD Pin Connections:

Pin Name	Function	Description
DATA_CLK	DSD CLK	DSD Clock
DATA1	DSD CH1	DSD DATA Channel 1
DATA2	DSD CH2	DSD DATA Channel 2
DATA3	DSD CH3	DSD DATA Channel 3
DATA4	DSD CH4	DSD DATA Channel 4
DATA5	DSD CH5	DSD DATA Channel 5
DATA6	DSD CH6	DSD DATA Channel 6
DATA7	DSD CH7	DSD DATA Channel 7
DATA8 ¹	DSD CH8	DSD DATA Channel 8

Table 4 - DSD Pin Connections

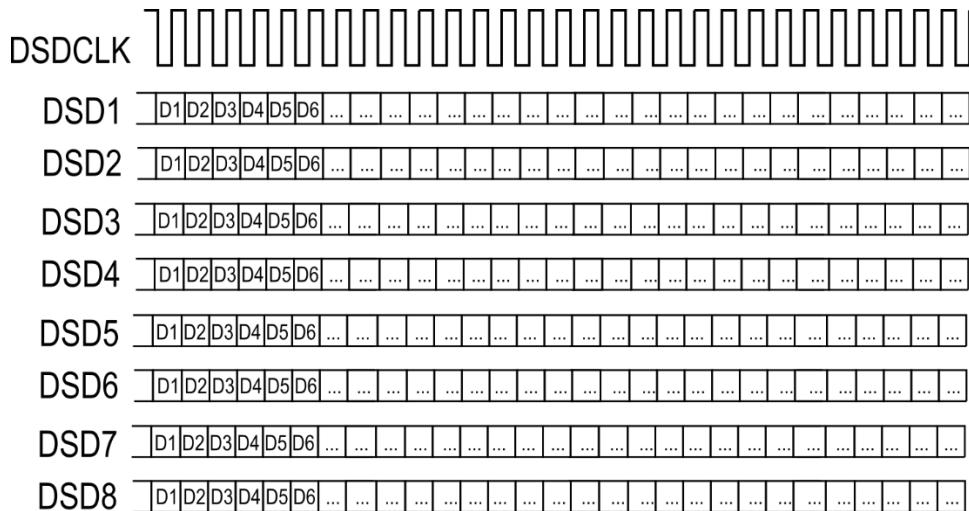

Figure 9 - DSD Format, 1-bit stream

¹ To use 8CH DSD, the MCLK/GPIO1/DATA8 pin must act as DATA8, therefore the chip must generate its MCLK from the PLL.

ES9081 Product Datasheet

PDM Decoder

PDM Data is input through the PDM decoder to be converted to DSD internally, following the rest of the respective internal data path including the DSD Channel Mapping, Automute, and DSD FIR and Volume blocks.

PDM Decoder Registers

- Register 1[7] ENABLE_PDM_DECODE
- Register 19[7] PDM_DATA_PHASE
- Register 19[6] PDM_FRAME_EDGE
- Register 20[6] PDM_2X_GAIN_EN

PDM Format

In PDM mode, there is a single PDM clock line and multiple PDM data lines containing two channels of data each. The channels can be swapped by setting Register 19[7] PDM_DATA_PHASE.

Pin Name	Function	Description
DATA_CLK	PDM CLK	PDM Clock
DATA1	PDM DATA1	PDM Data Channel 1 & 2
DATA2	PDM DATA2	PDM Data Channel 3 & 4
DATA3	PDM DATA3	PDM Data Channel 5 & 6
DATA4	PDM DATA4	PDM Data Channel 7 & 8

Table 5 - PDM Pin Connections

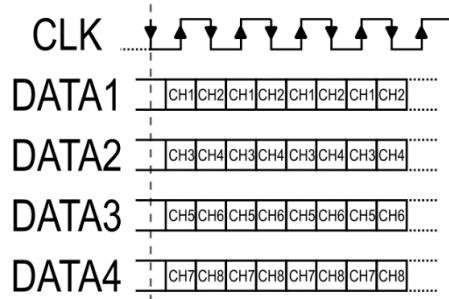

Figure 10 - PDM 8 Channel Format

S/PDIF Encoder

The ES9081 features a stereo S/PDIF encoder that can directly output a pair of channels (1/2, 3/4, 5/6, 7/8) from after the ASP or the TDM mix signal being output by the PCM/TDM Decoder. The S/PDIF channel status bits can be updated one byte at a time using the below address and data registers and toggling the write enable register to set the status bits.

Sample rates of up to 192kHz are supported

S/PDIF Encoder Registers

- Register 23[4] SPDIF_MIX_DATA_SEL
- Register 23[3:2] SPDIF_CH_PAIR_SEL
- Register 23[1] ENABLE_SPDIF_ENCODE
- Register 24[7] SPDIF_CS_WE
- Register 24[2:0] SPDIF_CS_BYTE_ADDR
- Register 25[7:0] SPDIF_CS_BYTE_DATA

Digital Signal Path

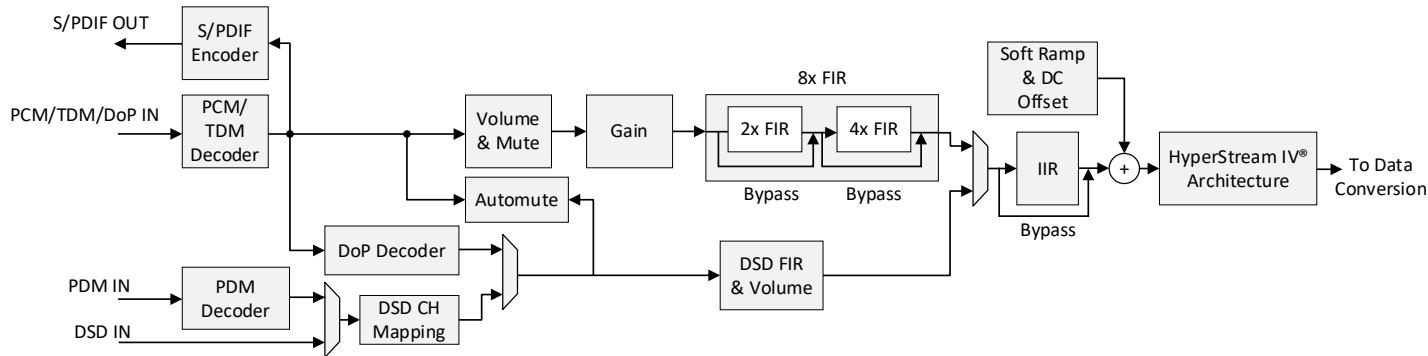

Figure 11 - Digital Signal Path

Volume Control

The Volume Control is intended for use during audio playback. Each channel can be digitally attenuated from +1dB to -126dB in 0.5dB steps. When a new volume level is set, the attenuation circuit will ramp softly to the new level at a rate specified in the VOLUME UP RAMP RATE and VOLUME DOWN RAMP RATE registers.

The ES9081 also features the ability to manually mute specific channels, invert the volume control phase as well as control all channel volumes with the CH1 volume control.

Volume Control Registers

- Register 87-94 VOLUME CHx
- Register 102 VOLUME UP RAMP RATE
- Register 103 VOLUME DOWN RAMP RATE
- Register 100 MUTE
- Register 95 PHASE INVERSION
- Register 101[6] MONO_VOLUME

ES9081 Product Datasheet

Gain

The ES9081 has a digital pre-gain of up to +42dB in 6 dB (+6,+12,+18,+24,+30,+36,+42) steps.

Gain Registers

- Register 96-99 DIGITAL GAIN

The digital pre-gain and volume control can be used together for finer resolution. Figure 19 shows the available ranges:

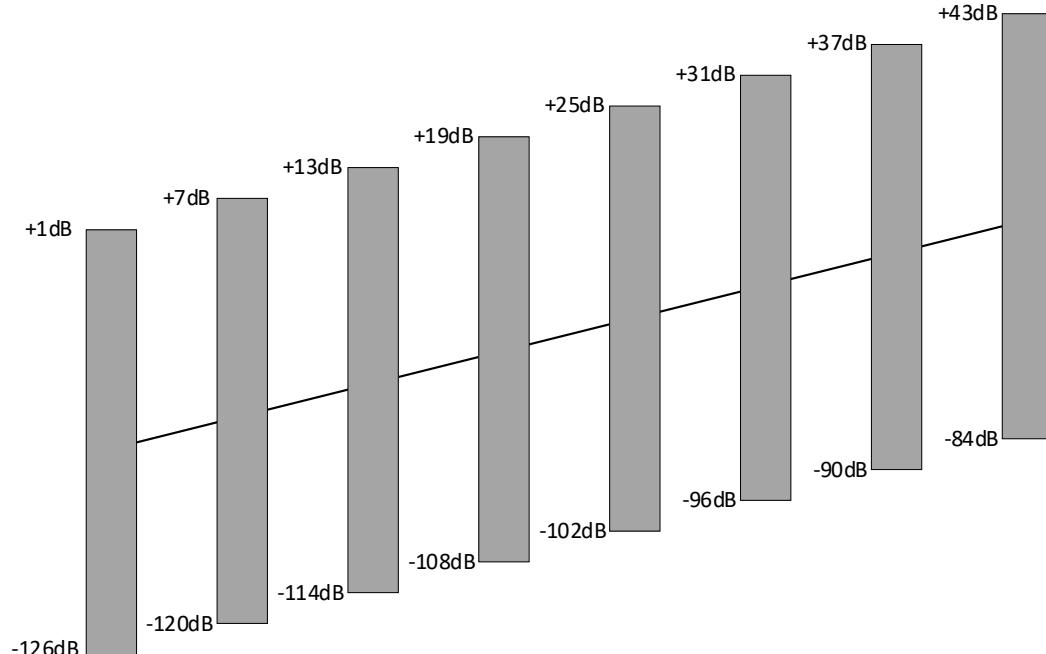

Figure 12 - ES9081 Volume Range

Automute

The ES9081 features an automute that triggers when the signal is below the specified level for longer than the specified time. The automute will disengage when the signal is above the specified off value for the same amount of time.

Note: Automute in DSD mode has additional registers that require configuration. Automute will trigger if it detects a DC level or automute patterns for the duration of automute_time.

$$Time[s] = \frac{2^{18} * 2^{64FS_MODE}}{AUTOMUTE_TIME * FS}$$

$$Level[dB] = \frac{20 * \log_{10}(AUTOMUTE_LEVEL)}{(2^{16} - 1) * 2^7}$$

$$Level_{OFF}[dB] = \frac{20 * \log_{10}(AUTOMUTE_OFF_LEVEL)}{(2^{16} - 1) * 2^7}$$

Automute Registers

- Register 105 AUTOMUTE_ENABLE
- Register 106-107 [10:0] AUTOMUTE_TIME
- Register 108-109 AUTOMUTE_LEVEL
- Register 110-111 AUTOMUTE_OFF_LEVEL

DSD Automute Settings Registers

- Register 106-107[15] DSDFAULT_DETECT_EN
- Register 106-107[14] DSD_DC_AM_ENB
- Register 106-107[13] DSD_MUTE_AM_ENB

8x FIR Filter

Selection of the 8x interpolation filter is chosen from 8 pre-programmed filters. The 2x and 4x filter can be bypassed individually or together. For more information on filters see the Pre-Programmed Digital Filters section.

8x FIR Registers

- Register 86[2:0] FILTER_SHAPE
- Register 86[3] BYPASS_FIR2X
- Register 86[4] BYPASS_FIR4X

IIR Filter

The IIR filter can be bypassed using Register 86[5] BYPASS_IIR

Soft Ramp & DC Offset

The ES9081 saves power by ramping to ground during a normal mute condition. This includes automute, register mute, and, GPIO mute.

A DC offset can be added to all 8 datapath signals in 100uV increments.

Soft Ramp & DC Offset Registers

- Register 101[5] MUTE_RAMP_TO_GROUND
- Register 101[4:0] SOFT_RAMP_TIME
- Register 104 DC_OFFSET

ES9081 Product Datasheet

GPIO Configuration

GPIO_CONFIG	Function	I/O Direction
0	Analog Outputs Off	Shutdown
1	Output 1'b0	Output
2	Output 1'b1	Output
3	Clock Valid	Output
4	PLL Locked Flag	Output
5	DAC Minimum Volume Flag	Output
6	DAC Automute Status	Output
7	DAC Soft Ramp Done Flag	Output
8	Mute DAC	Input
9	System Mode Control	Input
10	OR of Status Bits	Output
11	S/PDIF Stream	Output
12	PWM Signal	Output
13	MCLK_128FS	Output
14	Reserved	-
15	Reserved	-

Table 6 - GPIO Configuration

Analog Outputs Off

The GPIO is shutdown and has no functionality.

Output 1'b0

Outputs a constant 1'b0.

Output 1'b1

Outputs a constant 1'b1.

Clock Valid

Outputs HIGH if a MCLK source is detected. Outputs LOW when clock is removed or not present.

Note: Must have Register 3[1] EN_CLK_DET set for detection circuit to function.

PLL Locked Flag

Outputs HIGH if the PLL is locked.

DAC Minimum Volume Flag

Outputs HIGH when the DAC is muted. This can occur from manually muting via GPIO or a register, automuting, setting volume to 0xFF, loss of PLL lock, or an invalid MCLK/BCK ratio is detected via Register 7[6] ENABLE_BCK_MONITOR.

Relevant Registers

- Register 74-75[13] GPIO_AND_VOL_MIN sets the output to be the logical AND of both channels' mute flags.
- Register 76-77[13] GPIO_OR_VOL_MIN sets the output to be the logical OR of both channels' mute flags.

DAC Automute Status

Outputs HIGH when the DACs automute condition is met.

Relevant Registers

- Register 74-75[14] GPIO_AND_AUTOMUTE sets the output to be the logical AND of both channels' automute flags.
- Register 76-77[14] GPIO_OR_AUTOMUTE sets the output to be the logical OR of both channels' automute flags.

DAC Soft Ramp Done Flag

Outputs HIGH when the DAC is neither ramping up nor down.

Relevant Registers

- Register 74-75[15] GPIO_AND_SS_RAMP sets the output to be the logical AND of both channels' automute flags.
- Register 76-77[15] GPIO_OR_SS_RAMP sets the output to be the logical OR of both channels' automute flags.

Mute DAC

Mute all DAC channels.

System Mode Control

Sets the ability to turn the DAC on and off via a GPIO.

Relevant Registers

- Register 72-73[14] GPIO_FSM_MODE sets whether the GPIO has an enable or enable bar functionality
 - GPIO_FSM_MODE = 1'b0: Disable datapath when the GPIO input is 1'b1
 - GPIO_FSM_MODE = 1'b1: Enable datapath when the GPIO input is 1'b1.
- Note: When GPIO_FSM_MODE = 1'b0, the system mode will be determined by Register 0[0] ENABLE_DAC_REG

OR of Status Bits

Outputs the logical OR of all the currently masked status flags.

Relevant Registers

- Registers 36-38 STATUS BITS MASKP 1-4
- Registers 39-43 STATUS BITS MASKN 1-4
- Registers 44-47 STATUS BITS CLEAR 1-4

S/PDIF Stream

Outputs the S/PDIF stream. Requires Register 23[1] ENABLE_SPDIF_ENCODE to be set.

ES9081 Product Datasheet

PWM Signal

Outputs a configurable PWM signal. The frequency and duty cycle of the PWM signal can be calculated with the following equations:

$$\text{frequency [Hz]} = \frac{\text{MCLK}}{\text{PWM_FREQ} + 1}$$

$$\text{Duty Cycle [\%]} = \left(\frac{\text{PWM_COUNT}}{\text{PWM_FREQ} + 1} \right) \times 100$$

Relevant Registers

- Register 82 PWM COUNT
- Register 83-84 PWM FREQUENCY

MCLK_128FS

Outputs the MCLK_128FS clock. Requires the DAC to be on.

$$\text{MCLK_128FS} = \frac{\text{FS} * 2^7}{2^{64\text{FS_MODE}}}$$

Pre-Programmed Digital Filters

The ES9081 has 8 pre-programmed digital filters. The latency for each filter reduces (scales) with increasing sample rates. (See Register 86[2:0] FILTER_SHAPE for configuration)

#	Filter	Description
1	Minimum Phase (default)	Version 2 of minimum phase fast roll-off (#6) with less ripple and more image rejection
2	Linear Phase Apodizing Fast Roll-Off	Full image rejection by FS/2 to avoid any aliasing, with smooth roll-off starting before 20k.
3	Linear Phase Fast Roll-Off	Sabre legacy filter, optimized for image rejection @ 0.55FS
4	Linear Phase Fast Roll-Off Low-Ripple	Sabre legacy filter, optimized for in-band ripple
5	Linear Phase Slow Roll-Off	Sabre legacy filter, optimized for lower latency, but symmetric impulse response
6	Minimum Phase Fast Roll-Off	Low latency, minimal pre ringing and low passband ripple, image rejection @ 0.55FS
7	Minimum Phase Slow Roll-Off	Lowest latency at the cost of image rejection
8	Minimum Phase Fast Roll-Off Low Dispersion	Provides a nice balance of the low latency of minimum phase filters and the low dispersion of linear phase filters. Minimal pre-ringing is added to achieve the low dispersion in the audio band.

Table 7 - Pre-Programmed Digital Filter Descriptions

Note: Minimum phase filters are asymmetric filters that work to minimize the pre-echo of the filter, while still maintaining an excellent frequency response and they peak earlier than linear phase filters, resulting in a lower group delay. Minimum phase filters usually feature zero cycles of pre-echo, which can result in improved audio quality.

ES9081 Product Datasheet

PCM Filter Latency

The following table shows the simulated latency of each filter at 44.1kHz sampling rate. Measurements were taken from the external impulse response. The extra sample delay to get the data encoded accounts for external processing time to serialize the data stream. Latency will reduce (scale) with sampling rate.

Digital Filter	Delay
Minimum Phase (default)	5.34 / FS
Linear Phase Apodizing Fast Roll-Off	34.70 / FS
Linear Phase Fast Roll-Off	35.33 / FS
Linear Phase Fast Roll-Off Low-Ripple	33.27 / FS
Linear Phase Slow Roll-Off	7.78 / FS
Minimum Phase Fast Roll-Off	5.32 / FS
Minimum Phase Slow Roll-Off	4.36 / FS
Minimum Phase Fast Roll-Off Low Dispersion	11.3 / FS

Table 8 - PCM Filter Latency

Table 10 - PCM Filter Frequency Response

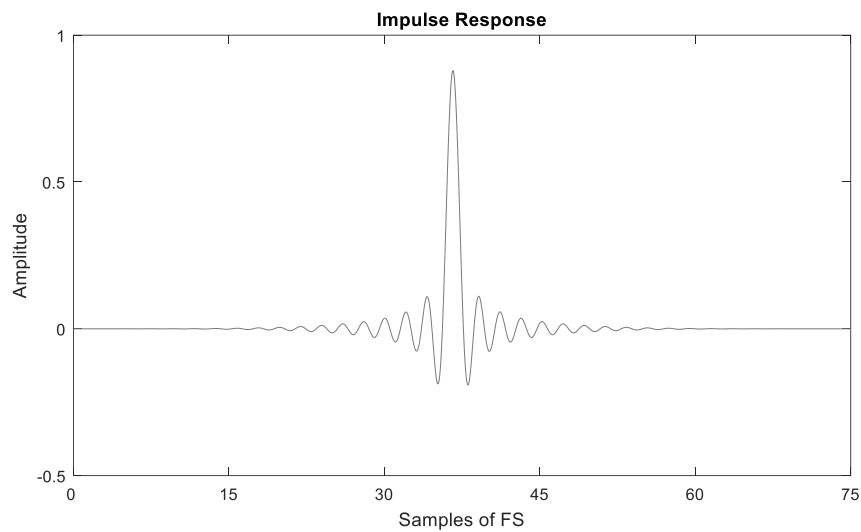

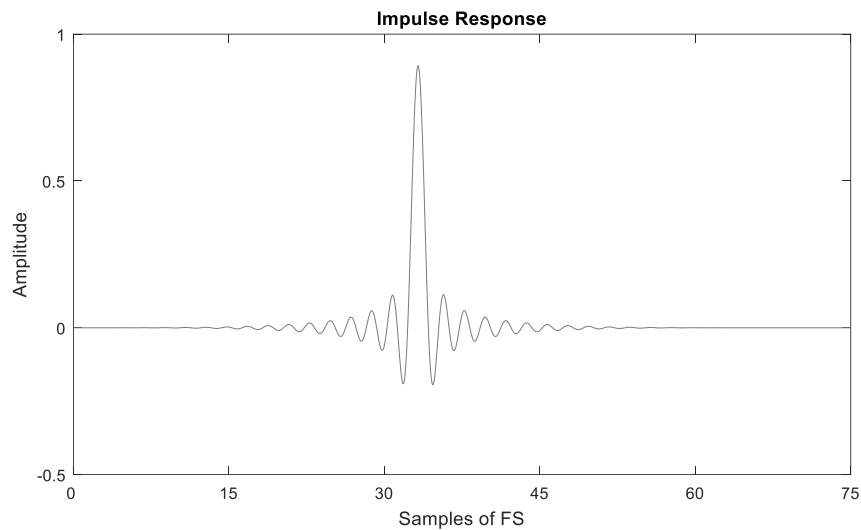

PCM Filter Impulse Response

The following impulse responses were obtained from software simulations of these filters. They were measured from the external impulse response. The extra sample delay to get the data encoded accounts for external processing time to serialize data stream.

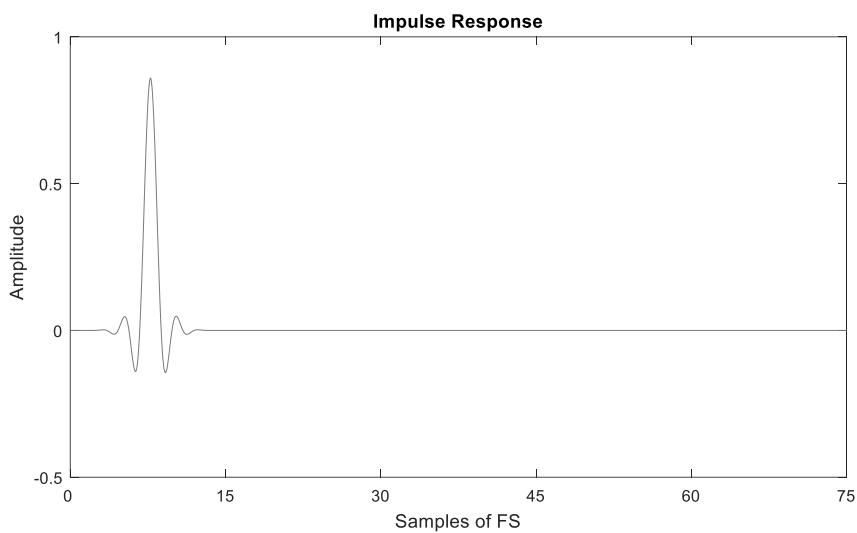

Filter	Impulse Response
Minimum Phase	 A line graph titled "Impulse Response". The x-axis is labeled "Samples of FS" and ranges from 0 to 75 with major ticks every 15 units. The y-axis is labeled "Amplitude" and ranges from -0.5 to 1.0 with major ticks at -0.5, 0, 0.5, and 1. The plot shows a sharp peak at approximately sample 5 with an amplitude of about 0.7. Subsequent smaller peaks decrease in amplitude, with the next significant peak around sample 12 and another around sample 25. The signal then decays rapidly towards zero by sample 35, remaining near zero thereafter.
Linear Phase Apodizing	 A line graph titled "Impulse Response". The x-axis is labeled "Samples of FS" and ranges from 0 to 75 with major ticks every 15 units. The y-axis is labeled "Amplitude" and ranges from -0.5 to 1.0 with major ticks at -0.5, 0, 0.5, and 1. The plot shows a very narrow, sharp central peak at approximately sample 33 with an amplitude of about 0.8. There are a few smaller side lobes around samples 28 and 38, and the signal quickly returns to zero amplitude for all other samples.

Table 11 - PCM Filter Impulse Response

64FS Mode

When the MCLK/FS ratio is required to be 64, it is necessary for the ES9081 to be in 64FS mode. 64FS Mode can be enabled by setting:

Registers

- Register 0[1] ENABLE_64FS_MODE = 1'b1
 - Manually enables 64FS mode
 - Should be used with high sample rates like 705.6kHz & 768kHz
- Register 0[2] AUTO_FS_DETECT = 1'b1
 - Sets the MCLK_128FS divider according to MCLK/FS ratio
 - Automatically enables 64FS mode when MCLK/MCLK_128FS ratio is 64
- 64FS mode can be blocked when AUTO_FS_DETECT is enabled by setting:
 - Register 0[3] AUTO_FS_BLOCK_64FS = 1'b1

Minimum Phase 64FS Mode Latency

The following table shows the simulated latency at 705.6kHz sampling rate and is very similar at 768kHz. Measurements were taken from the external impulse response. The extra sample delay to get the data encoded accounts for external processing time to serialize the data stream. Latency delay will reduce (scale) with sampling rate.

Digital Filter	Delay

Stop band	-61.29 dB	0.68 FS			Hz
Group Delay		1.54/FS		2.35/FS	s
Flatness (ripple)					dB

Table 13 - Minimum Phase 64FS Properties

ES9081 Product Datasheet

Minimum Phase 64FS Frequency Response

This filter gets selected automatically when MCLK/FS = 64. The following frequency response was obtained from software simulations with a sample rate of 705.6kHz

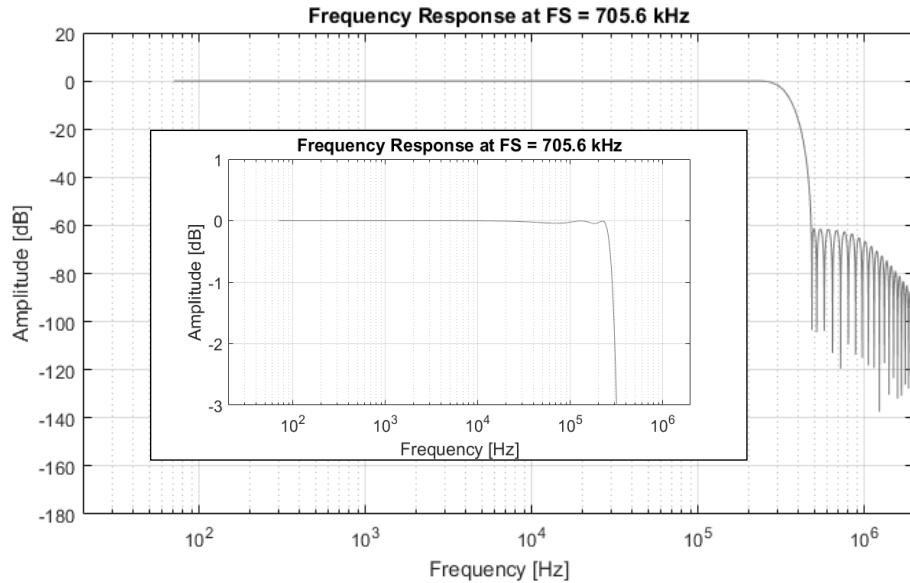

Figure 13 - Minimum Phase 64FS Frequency Response

The following impulse responses were obtained from software simulations of these filters. They were measured from the external impulse response. The extra sample delay to get the data encoded accounts for external processing time to serialize data stream.

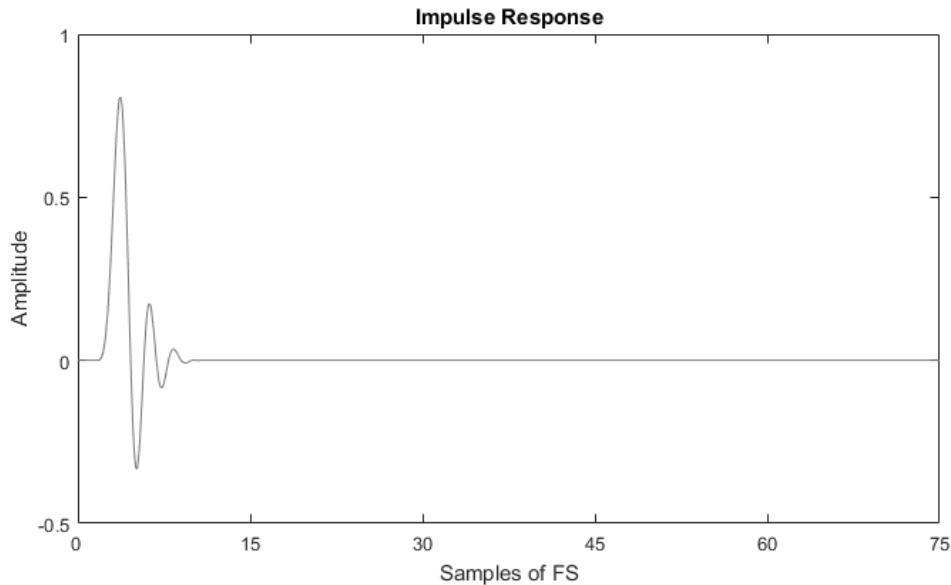

Figure 14 - Minimum Phase 64FS Impulse Response

Analog Features

APLL

The ES9081 has a built in Analog PLL (APLL) for generating frequencies that are unavailable externally. For an application note on the APLL, please ask your FAE or distributor for availability.

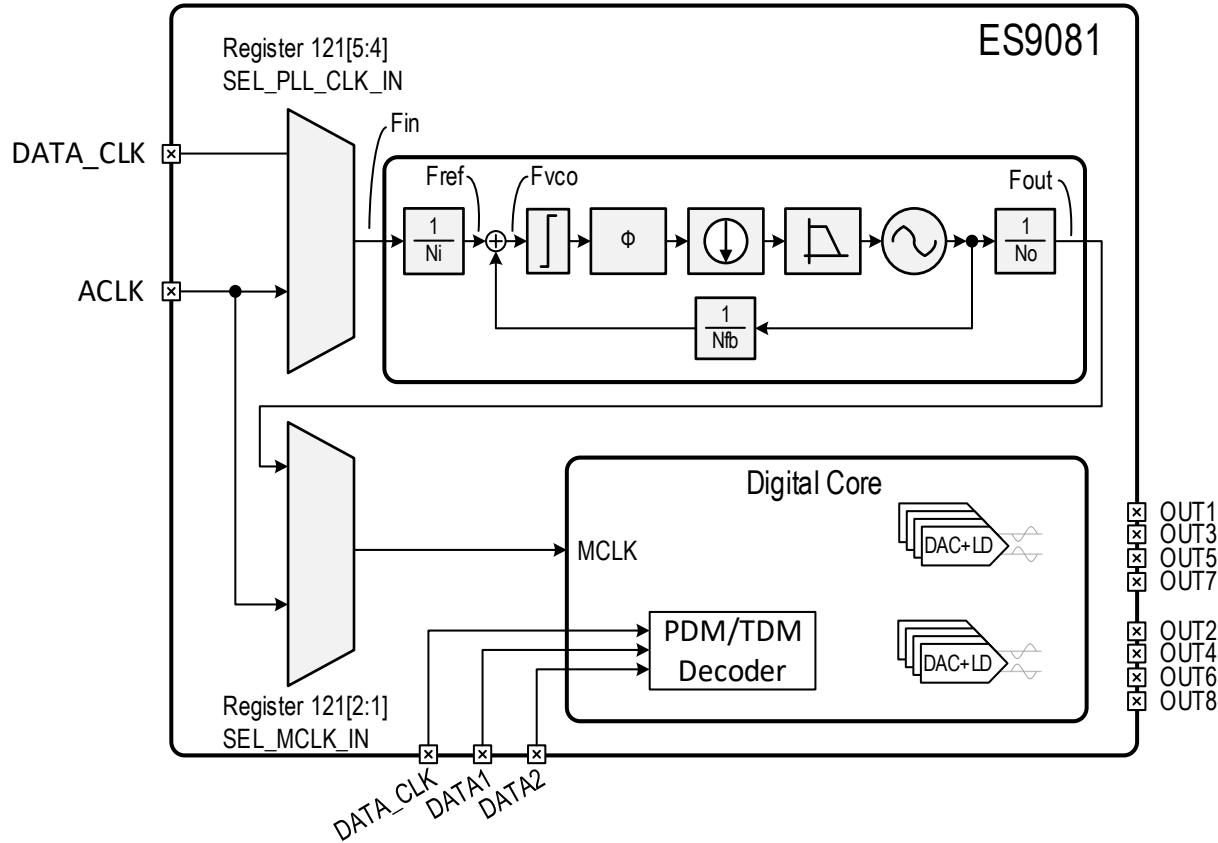

Figure 15 - Functional Block Diagram of ES9081 APLL

The input clock (F_{in}) source to the APLL is chosen between ACLK or DATA_CLK with Register 121[5:4] SEL_PLL_CLK_IN. The input MCLK source to the chip is chosen between the APLLs output or the ACLK pin with Register 121[2:1] SEL_MCLK_IN.

ES9081 Product Datasheet

For calculation of the PLL frequency output, use the following formulas:

$$F_{ref} = \left(\frac{F_{in}}{N_i}\right) \quad F_{vco} = \left(\frac{F_{in}}{N_i}\right) * N_{fb} \quad N_{fb} = \frac{2^{25}}{FBDIV} \quad F_{out} = \left(\frac{F_{in}}{N_i}\right) * \frac{N_{fb}}{N_o}$$

Where:

- a. FBDIV is a 24-bit number
- b. PLL frequency range requirements:
 - a. Fref requirement: 2.5MHz < Fref < 12 MHz
 - b. Fvco requirement: 90MHz < Fvco < 110MHz
 - c. Fout requirement: 22.5792/24.576MHz & 45.1584/49.152Mhz
- c. Ni = input divider
 - Accessible from Reg 127-129[8:0], PLL_CLK_IN_DIV
- d. No = output divider
 - Accessible from Reg 127-129[15:12], PLL_CLK_OUT_DIV
- e. Nfb = feedback divider
 - Accessible from Reg 124-126[23:0], PLL_CLK_FB_DIV
 - Note: Toggle Reg 127-129 PLL_FB_DIV_LOAD to load PLL_CLK_FB_DIV value

PNEG		Internal

Table 22 - Recommended Operating Conditions

Charge Pump

The ES9081 features an integrated Charge Pump (CP) that produces the internal negative supply required for the “ground centered” line drivers, on pin 18 (PNEG). The CP will automatically shut down, saving power, when a mute condition is detected. This function can be disabled by setting Reg 48[0] CP_MUTE_PD_EN = 1'b0.

The charge pump clock must be set to 705.6kHz or 768kHz depending on the sample rate multiple (44.1kHz/48kHz respectively). This is done by setting the value of CP_CLK_DIV to result in a charge pump clock of 705.1kHz/768kHz. CP_CLK_DIV (default 8d'31) is not required to change when the MCLK rate is 22.5792MHz/24.576MHz or 45.1584MHz/49.152MHz when the MCLK_RATE_SEL register is selected correctly. It will divide the clock automatically according to the equation below. If MCLK is another frequency, then the CP_CLK_DIV must also be set to ensure CP_CLK is in the required range.

$$\text{CP_CLK [Hz]} = \frac{\text{MCLK}}{2^{\text{MCLK_RATE_SEL}} \cdot (\text{CP_CLK_DIV} + 1)}$$

$$\text{CP_CLK_DIV} = \frac{\text{MCLK}}{2^{\text{MCLK_RATE_SEL}} \cdot \text{CP_CLK}} - 1$$

Charge Pump Registers

- Register 2[7] MCLK_RATE_SEL
- Register 51[7:0] CP_CLK_DIV (Default is 8'd31)
- Register 49[0] CP_MUTE_PD_EN

ES9081 Product Datasheet

Recommended Power Up/Down Sequence

The recommended power up sequence for the ES9081, the AVCC supply is enabled ~200us before AVCC_3V3_L, AVCC_3V3_R, and AVCC_CP are enabled.

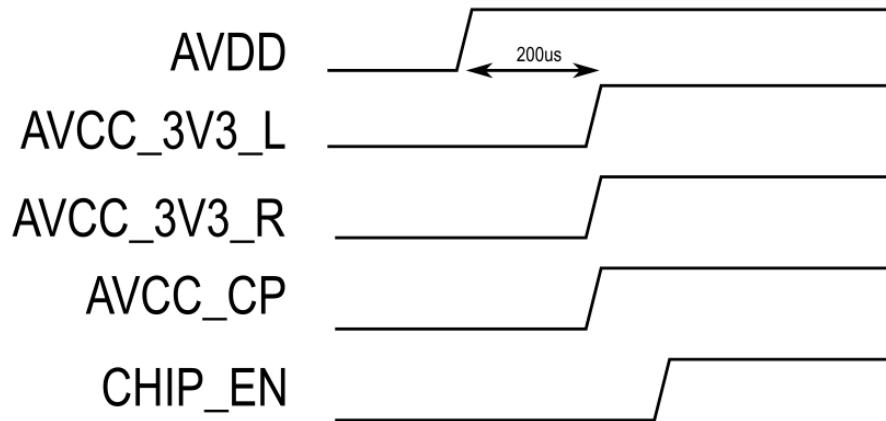

Figure 18 – Recommended Power Up Sequence

On power down, after CHIP_EN is disabled, AVCC_3V3_L, AVCC_3V3_R, AVCC_CP, and AVCC supplies are disabled.

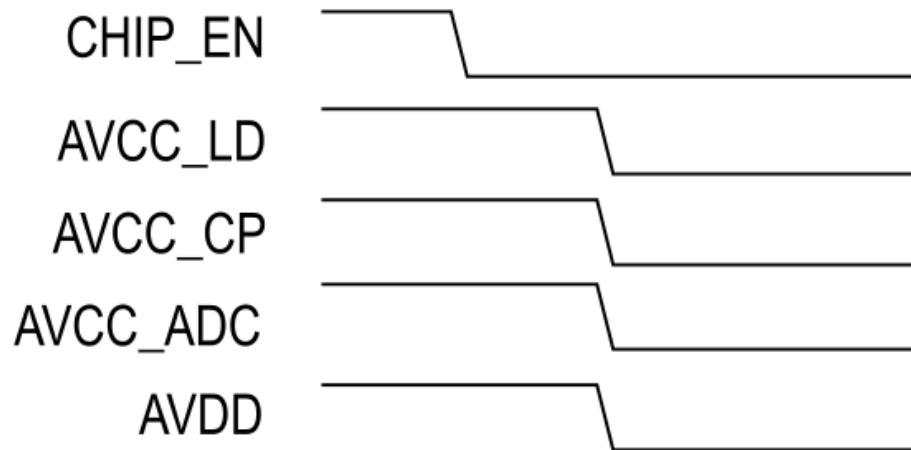

Figure 19 – Recommended Power Down Sequence

Power Consumption

Test Conditions (unless otherwise noted)

$T_A = 25^\circ\text{C}$, AVCC_3V3_L = AVCC_3V3_R = AVCC_CP = AVDD = +3.3V, 0dBFS digital input. AVDD includes DVDD current.

Table 24 - Performance

Register Overview

A system clock is not required to access registers.

Read/Write Register Addresses

Registers 0-135 (0x00 - 0x87) are read and write registers.

Read-Only Register Addresses

Register 224-250 (0xE0 - 0xFA) are read only registers.

Multi-Byte Registers

Multi-Byte registers must be written from LSB to MSB. Data is latched when MSB is written.

Multi-Byte registers must be read from LSB to MSB. Data is latched when LSB is read.

MSB is always stored in the highest register address.

Register Listing

System Registers

Register 0: SYS CONFIG

Bits	[7]	[6]	[5:4]	[3]	[2]	[1]	[0]
Default	1'b0	1'b0	2'b00	1'b0	1'b1	1'b0	1'b0

Bits	Mnemonic	Description
[7]	SOFT_RESET	Performs soft reset to digital core, resetting all registers to their power-on defaults.
[6]	RESERVED	N/A
[5:4]	I2C_ADDR	Sets the I ² C address of the device. <ul style="list-style-type: none"> 2'b00: 0x90 (default) 2'b01: 0x92 2'b10: 0x94 2'b11: 0x96
[3]	AUTO_FS_BLOCK_64FS	Block AUTO_FS_DETECT from transitioning to 64FS mode when the detected MCLK/MCLK_128FS ratio is 64. <ul style="list-style-type: none"> 1'b0: Disabled (default) 1'b1: Enabled
[2]	AUTO_FS_DETECT	Automatically determine optimal (MCLK/MCLK_128FS ratio) according to detected FS. <ul style="list-style-type: none"> 1'b0: Disabled, use SELECT_MCLK_128FS_NUM to set ratio. 1'b1: Enabled, overrides SELECT_MCLK_128FS_NUM (default)
[1]	EN_64FS_MODE	Enables 64FS mode for 768k sample rate. <ul style="list-style-type: none"> 1'b0: Disabled (default) 1'b1: Enabled
[0]	ENABLE_DAC	Enables the DAC interpolation path. <ul style="list-style-type: none"> 1'b0: Disabled (default) 1'b1: Enabled

ES9081 Product Datasheet

Register 1: DIGITAL INPUT CONFIG

Bits	[7]	[6]	[5]	[4]	[3]	[2:1]	[0]
Default	1'b0	1'b0	1'b0	1'b1	1'd0	2'd0	1'b0

Bits	Mnemonic	Description
[7]	ENABLE_PDM_DECODE	Enables PDM decoding. <ul style="list-style-type: none"> • 1'b0: Disabled (default) • 1'b1: Enabled
[6]	ENABLE_DSD_DECODE	Enables DSD decoding. <ul style="list-style-type: none"> • 1'b0: Disabled (default) • 1'b1: Enabled
[5]	ENABLE_DOP_DECODE	Enables DoP decoding. <ul style="list-style-type: none"> • 1'b0: Disabled (default) • 1'b1: Enabled
[4]	ENABLE_TDM_DECODE	Enables I ² S/TDM decoding. <ul style="list-style-type: none"> • 1'b0: Disabled • 1'b1: Enabled (default)
[3]	RESERVED	N/A
[2:1]	INPUT_SEL	Selects input data format when AUTO_INPUT_SEL is disabled. <ul style="list-style-type: none"> • 2'd0: PCM (default) • 2'd1: DSD • 2'd2: DoP • 2'd3: Reserved
[0]	AUTO_INPUT_SEL	Automatic input data selection config. <ul style="list-style-type: none"> • 1'b0: Disables auto input select. Input data format is set by INPUT_SEL (default) • 1'b1: Automatically determine the input data format.

Register 2: CLOCK CONTROL

Bits	[7]	[6]	[5:0]
Default	1'b0	1'b0	6'd3

Bits	Mnemonic	Description
[7]	MCLK_RATE_SEL	Sets the frequency of MCLK, allowing controls to automatically scale between MCLK rates. <ul style="list-style-type: none"> 1'b0: MCLK = 22.5792MHz / 24.576MHz (default) 1'b1: MCLK = 45.1584MHz / 49.152MHz
[6]	MCLK_128FS_HALF_DIV	<ul style="list-style-type: none"> 1'b0: Divide by MCLK_128FS_DIV + 1 (default) 1'b1: Divide by half of MCLK_128FS_DIV + 1 Note: Can only produce half of an odd number divide
[5:0]	MCLK_128FS_DIV	Whole number divide value + 1 for MCLK_128FS (MCLK/divide_value). <ul style="list-style-type: none"> 6'd0: Whole number divide value + 1 = 1 6'd3: Whole number divide value + 1 = 4 (default)

Register 3: MISC CLOCK CONTROLS

Bits	[7:3]	[2]	[1]	[0]
Default	5'd0	1'b0	1'b0	1'b0

Bits	Mnemonic	Description
[7:3]	RESERVED	N/A
[2]	DAC_CLK_INV	Inverts the phase of the analog DAC_CLK. <ul style="list-style-type: none"> 1'b0: Non-inverted (default) 1'b1: Inverted
[1]	EN_CLK_DET	Enable Clock Detection circuit <ul style="list-style-type: none"> 1'b0: Disabled (default) 1'b1: Enabled
[0]	FORCE_PLL_LOCK	Clock locking status control with PLL_LOCKED. <ul style="list-style-type: none"> 1'b0: clock locking status is determined by PLL_LOCKED 1'b1: ignores PLL_LOCKED signal from PLL and sets clock locking status to 1'b1

Register 4: PCM MASTER CLK CONFIG

Bits	[7:0]
Default	8'd7

Bits	Mnemonic	Description
[7:0]	MASTER_BCK_DIV	Master mode DCLK and WS generation clock divider. Whole number divide value + 1 for CLK_BCK_WS_GEN (MCLK/divide_value).

ES9081 Product Datasheet

Register 5: PCM MASTER MODE CONFIG

Bits	[7]	[6:5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0	2'b01	1'b0	1'b0	1'b1	1'b0	1'b0

Bits	Mnemonic	Description
[7]	SLAVE_BCK_INVERT	<ul style="list-style-type: none"> • 1'b0: Non-inverted (default) • 1'b1: Invert BCK input
[6:5]	RESERVED	N/A
[4]	MASTER_WS_PULSE_MODE	<p>When enabled, master WS is a 1 BCK pulse signal instead of a 50% duty cycle signal.</p> <ul style="list-style-type: none"> • 1'b0: 50% duty cycle WS signal (default) • 1'b1: Pulse WS signal
[3]	MASTER_WS_INVERT	<p>Inverts master WS.</p> <ul style="list-style-type: none"> • 1'b0: Non-inverted (default) • 1'b1: Inverted
[2]	MASTER_BCK_INVERT	<p>Inverts master BCK.</p> <ul style="list-style-type: none"> • 1'b0: Non-inverted • 1'b1: Inverted (default)
[1]	DSD_MASTER_MODE_EN	<p>Enables DSD master mode, generating DATA_CLK.</p> <ul style="list-style-type: none"> • 1'b0: Disabled, slave mode (default) • 1'b1: Enabled
[0]	PCM_MASTER_MODE_EN	<p>Enables PCM master mode, generating BCK and WS.</p> <ul style="list-style-type: none"> • 1'b0: Disabled, slave mode (default) • 1'b1: Enabled

Register 6: TDM CONFIG 1

Bits	[7]	[6]	[5]	[4:0]
Default	1'b0	1'b0	1'b0	5'd1

Bits	Mnemonic	Description
[7]	TDM_RESYNC	<p>Force TDM encoder & decoder to resync.</p> <ul style="list-style-type: none"> • 1'b0: Enable TDM codec synchronization (default) • 1'b1: Force TDM codec to desynchronize.
[6]	AUTO_CH_DETECT	<ul style="list-style-type: none"> • 1'b0: Disabled (default) • 1'b1: Auto detect BCK/FRAME ratio to determine the number of TDM channels <p>Note: Only active in TDM slave mode.</p>
[5]	RESERVED	N/A
[4:0]	TDM_CH_NUM	<p>Sets number of channels in each frame.</p> <ul style="list-style-type: none"> • 5'd0: 1 channel • 5'd1: 2 channels (default) • 5'd31: 32 channels

Register 7: TDM CONFIG 2

Bits	[7]	[6]	[5:4]	[3:2]	[1]	[0]
Default	1'b1	1'b1	2'b00	2'b00	1'b0	1'b0

Bits	Mnemonic	Description
[7]	ENABLE_WS_MONITOR	Enable WS monitor, used to detect the validity of the WS signal. WS is considered invalid if BCK/WS > 1024. <ul style="list-style-type: none">• 1'b0: Disabled• 1'b1: Enabled (default)
[6]	ENABLE_BCK_MONITOR	Enable BCK monitor, used to detect the validity of the BCK signal. BCK is considered invalid if MCLK/BCK > 256. <ul style="list-style-type: none">• 1'b0: Disabled• 1'b1: Enabled (default)
[5:4]	TDM_WORD_WIDTH	Sets the width, in bits, of one data word / subframe. A subframe is a frame divided by the number of channels. <ul style="list-style-type: none">• 2'b00: 32-bits (default)• 2'b01: 24-bits• 2'b10: 16-bits
[3:2]	TDM_BIT_DEPTH	Sets the bit depth, number of data bits, in one data word / subframe. <ul style="list-style-type: none">• 2'b00: 32-bit (default)• 2'b01: 24-bit• 2'b10: 16-bit
[1]	TDM_VALID_EDGE	Sets which WS edge the frame starts on. <ul style="list-style-type: none">• 1'b0: Frame starts on negedge of WS (default)• 1'b1: Frame starts on posedge of WS
[0]	TDM_LJ	Sets left-justified mode. <ul style="list-style-type: none">• 1'b0: One BCK period delay (default)• 1'b1: Left-justified

ES9081 Product Datasheet

Register 8: TDM CH1 SLOT CONFIG

Bits	[7]	[6:5]	[4:0]
Default	1'd0	2'd0	5'd0

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6:5]	TDM_LINE_SEL_CH1	CH1 data line selection. CH1 receives the data from: <ul style="list-style-type: none">• 2'd0: DATA2 (default)• 2'd1: DATA3/GPIO2• 2'd2: DATA4/GPIO3• 2'd3: DATA5/GPIO4
[4:0]	TDM_SLOT_SEL_CH1	Selects which TDM channel slot is latched into CH1. <ul style="list-style-type: none">• 5'd0: Slot 1 (default)• 5'd31: Slot 32

Register 9: TDM CH2 SLOT CONFIG

Bits	[7]	[6:5]	[4:0]
Default	1'd0	2'd0	5'd1

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6:5]	TDM_LINE_SEL_CH2	CH2 data line selection. CH2 receives the data from: <ul style="list-style-type: none">• 2'd0: DATA2 (default)• 2'd1: DATA3/GPIO2• 2'd2: DATA4/GPIO3• 2'd3: DATA5/GPIO4

Register 10: TDM CH3 SLOT CONFIG

Bits	[7]	[6:5]	[4:0]
Default	1'd0	2'd1	5'd0

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6:5]	TDM_LINE_SEL_CH3	CH3 data line selection. CH3 receives the data from: • 2'd0: DATA2 • 2'd1: DATA3/GPIO2 (default) • 2'd2: DATA4/GPIO3 • 2'd3: DATA5/GPIO4
[4:0]	TDM_SLOT_SEL_CH3	Selects which TDM channel slot is latched into CH3. • 5'd0: Slot 1 (default) • 5'd31: Slot 32

Register 11: TDM CH4 SLOT CONFIG

Bits	[7]	[6:5]	[4:0]
Default	1'd0	2'd1	5'd1

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6:5]	TDM_LINE_SEL_CH4	CH4 data line selection. CH4 receives the data from: • 2'd0: DATA2 • 2'd1: DATA3/GPIO2 (default) • 2'd2: DATA4/GPIO3 • 2'd3: DATA5/GPIO4
[4:0]	TDM_SLOT_SEL_CH4	Selects which TDM channel slot is latched into CH4. • 5'd0: Slot 1 • 5'd1: Slot 2 (default) • 5'd31: Slot 32

ES9081 Product Datasheet

Register 12: TDM CH5 SLOT CONFIG

Bits	[7]	[6:5]	[4:0]
Default	1'd0	2'd2	5'd0

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6:5]	TDM_LINE_SEL_CH5	CH5 data line selection. CH5 receives the data from: <ul style="list-style-type: none">• 2'd0: DATA2• 2'd1: DATA3/GPIO2• 2'd2: DATA4/GPIO3 (default)• 2'd3: DATA5/GPIO4
[4:0]	TDM_SLOT_SEL_CH5	Selects which TDM channel slot is latched into CH5. <ul style="list-style-type: none">• 5'd0: Slot 1 (default)• 5'd31: Slot 32

Register 13: TDM CH6 SLOT CONFIG

Bits	[7]	[6:5]	[4:0]
Default	1'd0	2'd2	5'd1

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6:5]	TDM_LINE_SEL_CH6	CH6 data line selection. CH6 receives the data from: <ul style="list-style-type: none">• 2'd0: DATA2• 2'd1: DATA3/GPIO2• 2'd2: DATA4/GPIO3 (default)• 2'd3: DATA5/GPIO4

[0]	RESERVED	N/A

Register 24: S/PDIF CS ADDR

Bits	[7]	[6:3]	[2:0]
Default	1'b0	4'd0	3'd0

Bits	Mnemonic	Description
[7]	SPDIF_CS_WE	Write enable for the S/PDIF channel status bits. Writes the SPDIF_CS_DATA to the byte at address SPDIF_CS_BYTE_SEL. Toggle high-low to perform a write.
[6:3]	RESERVED	N/A
[2:0]	SPDIF_CS_BYTE_ADDR	Byte of the 40-bit S/PDIF Channel Status register to write to.

Register 25: S/PDIF CS DATA

Bits	[7:0]
Default	8'h00

Bits	Mnemonic	Description
[7:0]	SPDIF_CS_BYTE_DATA	Data to write into the 40-bit S/PDIF Channel Status register.

Register 35-26: RESERVED

Register 36: STATUS BITS MASKP 1

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0							

Bits	Mnemonic	Description
[7]	VOL_MIN_CH8_MASKP	Masks negative to positive transitions of the CH8 "Minimum Volume" flag.
[6]	VOL_MIN_CH7_MASKP	Masks negative to positive transitions of the CH7 "Minimum Volume" flag.
[5]	VOL_MIN_CH6_MASKP	Masks negative to positive transitions of the CH6 "Minimum Volume" flag.
[4]	VOL_MIN_CH5_MASKP	Masks negative to positive transitions of the CH5 "Minimum Volume" flag.
[3]	VOL_MIN_CH4_MASKP	Masks negative to positive transitions of the CH4 "Minimum Volume" flag.
[2]	VOL_MIN_CH3_MASKP	Masks negative to positive transitions of the CH3 "Minimum Volume" flag.
[1]	VOL_MIN_CH2_MASKP	Masks negative to positive transitions of the CH2 "Minimum Volume" flag.
[0]	VOL_MIN_CH1_MASKP	Masks negative to positive transitions of the CH1 "Minimum Volume" flag.

ES9081 Product Datasheet

Register 37: STATUS BITS MASKP 2

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0							

Bits	Mnemonic	Description
[7]	AUTOMUTE_CH8_MASKP	Masks negative to positive transitions of the CH8 "Automute Status" flag.
[6]	AUTOMUTE_CH7_MASKP	Masks negative to positive transitions of the CH7 "Automute Status" flag.
[5]	AUTOMUTE_CH6_MASKP	Masks negative to positive transitions of the CH6 "Automute Status" flag.
[4]	AUTOMUTE_CH5_MASKP	Masks negative to positive transitions of the CH5 "Automute Status" flag.
[3]	AUTOMUTE_CH4_MASKP	Masks negative to positive transitions of the CH4 "Automute Status" flag.
[2]	AUTOMUTE_CH3_MASKP	Masks negative to positive transitions of the CH3 "Automute Status" flag.
[1]	AUTOMUTE_CH2_MASKP	Masks negative to positive transitions of the CH2 "Automute Status" flag.
[0]	AUTOMUTE_CH1_MASKP	Masks negative to positive transitions of the CH1 "Automute Status" flag.

Register 38: STATUS BITS MASKP 3

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0							

Bits	Mnemonic	Description
[7]	SS_FULL_RAMP_CH8_MASKP	Masks negative to positive transitions of the CH8 "Soft Ramp Done" flag.
[6]	SS_FULL_RAMP_CH7_MASKP	Masks negative to positive transitions of the CH7 "Soft Ramp Done" flag.
[5]	SS_FULL_RAMP_CH6_MASKP	Masks negative to positive transitions of the CH6 "Soft Ramp Done" flag.
[4]	SS_FULL_RAMP_CH5_MASKP	Masks negative to positive transitions of the CH5 "Soft Ramp Done" flag.
[3]	SS_FULL_RAMP_CH4_MASKP	Masks negative to positive transitions of the CH4 "Soft Ramp Done" flag.
[2]	SS_FULL_RAMP_CH3_MASKP	Masks negative to positive transitions of the CH3 "Soft Ramp Done" flag.
[1]	SS_FULL_RAMP_CH2_MASKP	Masks negative to positive transitions of the CH2 "Soft Ramp Done" flag.
[0]	SS_FULL_RAMP_CH1_MASKP	Masks negative to positive transitions of the CH1 "Soft Ramp Done" flag.

Register 39: STATUS BITS MASKP 4

Bits	[7]	[6:5]	[4]	[3]	[2]	[1]	[0]
Default	1'd0	2'b00	1'b0	1'b0	1'b0	1'b0	1'b0

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6:5]	INPUT_SEL_OVR_MASKP	Masks negative to positive transitions of either bit of the "INPUT_SEL_OVERRIDE" flag.
[4]	DOP_VALID_CH12_MASKP	Masks negative to positive transitions of CH1/2 channel pair "DOP_VALID" flag.
[3]	TDM_DATA_VALID_MASKP	Masks negative to positive transitions of the "TDM_DATA_VALID" flag.
[2]	BCK_WS_FAIL_MASKP	Masks negative to positive transitions of the "BCK_WS_FAIL" flag.
[1]	RESERVED	N/A
[0]	PLL_LOCKED_MASKP	Masks negative to positive transitions of the "PLL_LOCKED" flag.

Register 40: STATUS BITS MASKN 1

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0							

Bits	Mnemonic	Description
[7]	VOL_MIN_CH8_MASKN	Masks positive to negative transitions of the CH8 "Minimum Volume" flag.
[6]	VOL_MIN_CH7_MASKN	Masks positive to negative transitions of the CH7 "Minimum Volume" flag.
[5]	VOL_MIN_CH6_MASKN	Masks positive to negative transitions of the CH6 "Minimum Volume" flag.
[4]	VOL_MIN_CH5_MASKN	Masks positive to negative transitions of the CH5 "Minimum Volume" flag.
[3]	VOL_MIN_CH4_MASKN	Masks positive to negative transitions of the CH4 "Minimum Volume" flag.
[2]	VOL_MIN_CH3_MASKN	Masks positive to negative transitions of the CH3 "Minimum Volume" flag.
[1]	VOL_MIN_CH2_MASKN	Masks positive to negative transitions of the CH2 "Minimum Volume" flag.
[0]	VOL_MIN_CH1_MASKN	Masks positive to negative transitions of the CH1 "Minimum Volume" flag.

ES9081 Product Datasheet

Register 41: STATUS BITS MASKN 2

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0							

Bits	Mnemonic	Description
[7]	AUTOMUTE_CH8_MASKN	Masks positive to negative transitions of the CH8 "Automute Status" flag.
[6]	AUTOMUTE_CH7_MASKN	Masks positive to negative transitions of the CH7 "Automute Status" flag.
[5]	AUTOMUTE_CH6_MASKN	Masks positive to negative transitions of the CH6 "Automute Status" flag.
[4]	AUTOMUTE_CH5_MASKN	Masks positive to negative transitions of the CH5 "Automute Status" flag.
[3]	AUTOMUTE_CH4_MASKN	Masks positive to negative transitions of the CH4 "Automute Status" flag.
[2]	AUTOMUTE_CH3_MASKN	Masks positive to negative transitions of the CH3 "Automute Status" flag.
[1]	AUTOMUTE_CH2_MASKN	Masks positive to negative transitions of the CH2 "Automute Status" flag.
[0]	AUTOMUTE_CH1_MASKN	Masks positive to negative transitions of the CH1 "Automute Status" flag.

Register 42: STATUS BITS MASKN 3

Bits	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
Default	1'b0							

Bits	Mnemonic	Description
[7]	SS_FULL_RAMP_CH8_MASKN	Masks positive to negative transitions of the CH8 "Soft Ramp Done" flag.
[6]	SS_FULL_RAMP_CH7_MASKN	Masks positive to negative transitions of the CH7 "Soft Ramp Done" flag.
[5]	SS_FULL_RAMP_CH6_MASKN	Masks positive to negative transitions of the CH6 "Soft Ramp Done" flag.
[4]	SS_FULL_RAMP_CH5_MASKN	Masks positive to negative transitions of the CH5 "Soft Ramp Done" flag.
[3]	SS_FULL_RAMP_CH4_MASKN	Masks positive to negative transitions of the CH4 "Soft Ramp Done" flag.
[2]	SS_FULL_RAMP_CH3_MASKN	Masks positive to negative transitions of the CH3 "Soft Ramp Done" flag.
[1]	SS_FULL_RAMP_CH2_MASKN	Masks positive to negative transitions of the CH2 "Soft Ramp Done" flag.
[0]	SS_FULL_RAMP_CH1_MASKN	Masks positive to negative transitions of the CH1 "Soft Ramp Done" flag.

Register 43: STATUS BITS MASKN 4

Bits	[7]	[6:5]	[4]	[3]	[2]	[1]	[0]

Register 107-106: AUTOMUTE TIME

Bits	[15]	[14]	[13]	[12:11]	[10:0]
Default	1'b1	1'b0	1'b0	2'd0	11'h0F

Bits	Mnemonic	Description
[15]	DSDFAULT_DETECT_EN	Sets a channel to a DSD mute pattern (0x96) if the DSD data has no changes in 64 DATA_CLKs. <ul style="list-style-type: none"> • 1'b0: Disabled • 1'b1: Enabled (default)
[14]	DSD_DC_AM_ENB	Disables the DSD automute condition, if a DC signal is detected. <ul style="list-style-type: none"> • 1'b0: Enabled (default) • 1'b1: Disabled
[13]	DSD_MUTE_AM_ENB	Disables the DSD automute condition, if a DSD mute pattern is detected. <ul style="list-style-type: none"> • 1'b0: Enabled (default) • 1'b1: Disabled
[12:11]	RESERVED	N/A
[10:0]	AUTOMUTE_TIME	Configures the amount of time in seconds the audio must remain below AUTOMUTE_LEVEL before an automute condition is flagged. <ul style="list-style-type: none"> • 11'h000: Disabled • 11'h001: Slowest • 11'h00F: Default • 11'h7FF: Fastest $\text{Time [s]} = \frac{2^{18}}{\text{AUTOMUTE_TIME} \cdot FS}$

Register 109-108: AUTOMUTE LEVEL

Bits	[15:0]
Default	16'h0008

Bits	Mnemonic	Description
[15:0]	AUTOMUTE_LEVEL	The threshold which the audio must be below before an automute condition is flagged. <ul style="list-style-type: none"> • 16'h0001: -138dB • 16'h0008: -120dB (default) • 16'hFFFF: -42dB $\text{level [dB]} = 20 \cdot \log_{10} \left(\frac{\text{AUTOMUTE_LEVEL}}{(2^{16} - 1) \cdot 2^7} \right)$

ES9081 Product Datasheet

Register 111-110: AUTOMUTE OFF LEVEL

Bits	[15:0]
Default	16'h000A

Bits	Mnemonic	Description
[15:0]	AUTOMUTE_OFF_LEVEL	<p>The threshold which the audio must be above before the automute condition is immediately cleared.</p> <ul style="list-style-type: none"> • 16'h0001: -138dB • 16'h000A: -118dB (default) • 16'hFFFF: -42dB $\text{level [dB]} = 20 \cdot \log_{10} \left(\frac{\text{AUTOMUTE_OFF_LEVEL}}{(2^{16} - 1) \cdot 2^7} \right)$

Register 120-112: RESERVED

PLL Registers

Register 121: PLL CLOCK SELECT

Bits	[7]	[6]	[5:4]	[3]	[2:1]	[0]
Default	1'b0	1'b0	2'b10	1'b0	2'b00	1'b1

Bits	Mnemonic	Description
[7]	RESERVED	N/A
[6]	PLL_CLK_PHASE_INV	Digital/analog DAC clock invert phase enable. <ul style="list-style-type: none"> 1'b0: Digital/analog DAC clocks have inverted phase (default) 1'b1: Digital/analog DAC clocks have the same phase
[5:4]	SEL_PLL_CLK_IN	Selects PLL input clock source when EN_PLL_CLK_IN is set. <ul style="list-style-type: none"> 2'b00: ACLK 2'b10: DCLK (default) Others: Reserved
[3]	EN_PLL_CLK_IN	Allows SEL_PLL_CLK_IN to select PLL input clocks. <ul style="list-style-type: none"> 1'b0: Disables SEL_PLL_CLK_IN (default) 1'b1: Enables SEL_PLL_CLK_IN
[2:1]	SEL_MCLK_IN	Selects digital core clock source when EN_MCLK_IN is set. <ul style="list-style-type: none"> 2'b00: ACLK (default) 2'b10: PLL_CLK Others: Reserved
[0]	EN_MCLK_IN	Enables clock inputs to the digital core. <ul style="list-style-type: none"> 1'b0: Disabled 1'b1: Enabled (default)

Register 122: PLL VCO & CP

Bits	[7:4]	[3]	[2]	[1]	[0]
Default	4'b0011	1'b0	1'b0	1'b0	1'b0

Bits	Mnemonic	Description
[7:4]	RESERVED	N/A
[3]	PLL_CP_PDB	Enables/disables the PLL charge pump. <ul style="list-style-type: none"> 1'b0: Disabled (default) 1'b1: Enabled
[2]	PLL_VCO_PDB	Enables/disables the PLL voltage-controlled oscillator (VCO). <ul style="list-style-type: none"> 1'b0: Disabled (default) 1'b1: Enabled
[1]	PLL_CLKSMP_PDB	Power Down the PLL circuitry. <ul style="list-style-type: none"> 1'b0: PLL Block disabled (default) 1'b1: PLL Block enabled
[0]	PLL_DIG_RSTB	Resets the Digital core of the PLL.

ES9081 Product Datasheet

Register 123: PLL REGULATOR

Bits	[7:4]	[3]	[2:0]
Default	4'd0	1'b0	3'b010

Bits	Mnemonic	Description
[7:4]	RESERVED	N/A
[3]	PLL_REG_PDB	Power down the PLL regulator. <ul style="list-style-type: none"> • 1'b0: Disable the PLL regulator (default) • 1'b1: Enable the PLL regulator

Reflow Process Considerations

Temperature Controlled

For lead-free soldering, the characterization and optimization of the reflow process is the most important factor to consider.

The lead-free alloy solder has a melting point of 217°C. This alloy requires a minimum reflow temperature of 235°C to ensure good wetting. The maximum reflow temperature is in the 245°C to 260°C range, depending on the package size (RPC-2-Pb-Free Process - Classification Temperatures (T_c)). This narrows the process window for lead-free soldering to 10°C to 20°C.

The increase in peak reflow temperature in combination with the narrow process window makes the development of an optimal reflow profile a critical factor for ensuring a successful lead-free assembly process. The major factors contributing to the development of an optimal thermal profile are the size and weight of the assembly, the density of the components, the mix of large and small components, and the paste chemistry being used.

Reflow profiling needs to be performed by attaching calibrated thermocouples well adhered to the device as well as other critical locations on the board to ensure that all components are heated to temperatures above the minimum reflow temperatures and that smaller components do not exceed the maximum temperature limits (Table RPC-2).

To ensure that all packages can be successfully and reliably assembled, the reflow profiles studied and recommended by ESS are based on the JEDEC/IPC standard J-STD-020 revision D.1.

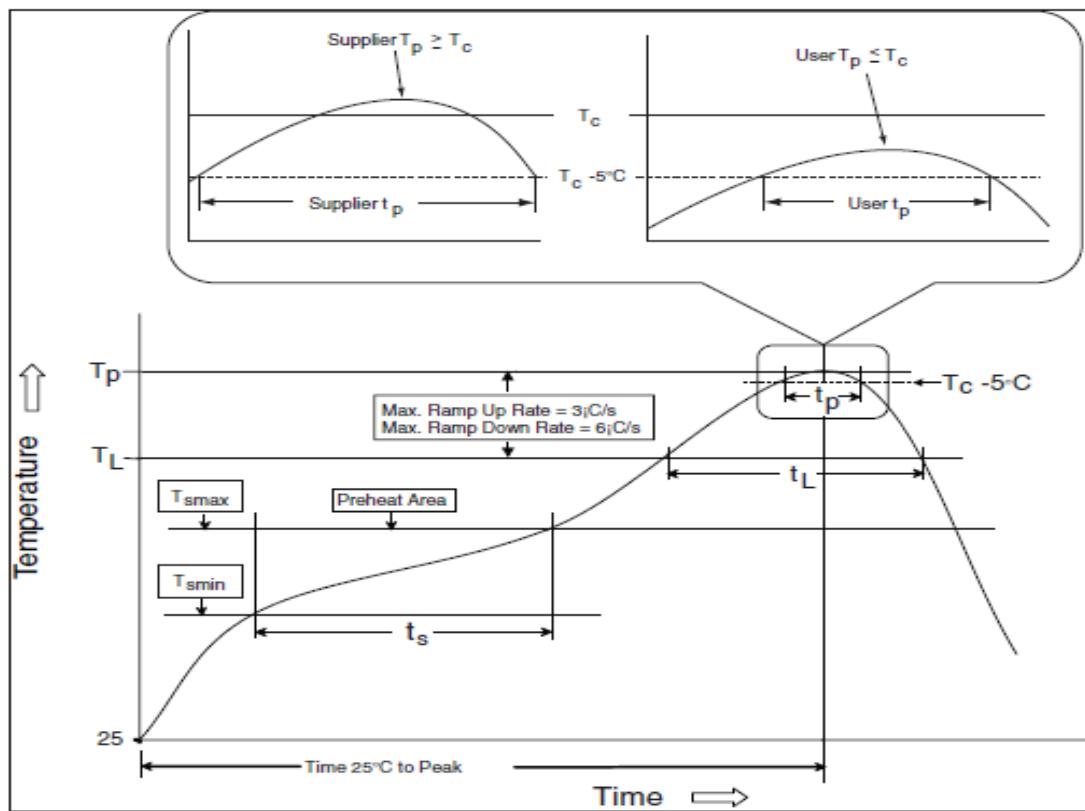

Figure 24 - IR/Convection Reflow Profile (IPC/JEDEC J-STD-020D.1)

Reflow is allowed 3 times. Caution must be taken to ensure time between re-flow runs does not exceed the allowed time by the moisture sensitivity label. If the time elapsed between the re-flows exceeds the moisture sensitivity time, bake the board according to the moisture sensitivity label instructions.

Manual

Allowed up to 2 times with maximum temperature of 350°C no longer than 3 seconds.

RPC-1 Classification Reflow Profile

Profile Feature	Pb-Free Assembly
Preheat/Soak	
Temperature Min (Tsmin)	150°C
Temperature Max (Tsmax)	200°C
Time (ts) from (Tsmin to Tsmax)	60-120 seconds
Ramp-up rate (TL to Tp)	3°C / second maximum
Liquidous temperature (TL)	217°C
Time (tL) maintained above TL	60-150 seconds
Peak package body temperature (Tp)	For users Tp must not exceed the classification temp in Table RPC-2. For suppliers Tp must equal or exceed the Classification temp in Table RPC-2.
Time (tp)* within 5°C of the specified classification temperature (Tc)	30* seconds
Ramp-down rate (Tp to TL)	6°C / second maximum
Time 25°C to peak temperature	8 minutes maximum

* Tolerance for peak profile temperature (Tp) is defined as a supplier minimum and a user maximum.

Table 26 - RPC-1 Classification Reflow Profile

All temperatures refer to the center of the package, measured on the package body surface that is facing up during assembly reflow (e.g., live-bug). If parts are reflowed in other than the normal live-bug assembly reflow orientation (i.e., dead-bug), Tp shall be within $\pm 2^\circ\text{C}$ of the live-bug Tp and still meet the Tc requirements, otherwise, the profile shall be adjusted to achieve the latter. To accurately measure actual peak package body temperatures, refer to JEP140 for recommended thermocouple use.

Reflow profiles in this document are for classification/preconditioning and are not meant to specify board assembly profiles. Actual board assembly profiles should be developed based on specific process needs and board designs and should not exceed the parameters in Table RPC-1.

For example, if Tc is 260°C and time tp is 30 seconds, this means the following for the supplier and the user.

For a supplier: The peak temperature must be at least 260°C. The time above 255°C must be at least 30 seconds.

For a user: The peak temperature must not exceed 260°C. The time above 255°C must not exceed 30 seconds.

All components in the test load shall meet the classification profile requirements.

ES9081 Product Datasheet

RPC-2 Pb-Free Process - Classification Temperatures (Tc)

Package Thickness	Volume mm ³ , <350	Volume mm ³ , 350 to 2000	Volume mm ³ , >2000
<1.6 mm	260°C	260°C	260°C
1.6 mm – 2.5 mm	260°C	250°C	245°C
>2.5 mm	250°C	245°C	245°C

Table 27 - RPC-2 Pb Free Classification Temperatures

At the discretion of the device manufacturer, but not the board assembler/user, the maximum peak package body temperature (Tp) can exceed the values specified in Table RPC-2. The use of a higher Tp does not change the classification temperature (Tc).

Package volume excludes external terminals (e.g., balls, bumps, lands, leads) and/or nonintegral heat sinks.

The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.
