

High PSRR, 1uA Ultra-Low Iq, 300mA LDO in DFN1x1 and SOT23-5

DESCRIPTION

ETA5071 is a fixed output, low-dropout (LDO) low-power linear voltage regulator that features ultra-low standby current as low as 1uA. It can withstand input voltage up to 7V and delivery 300mA at output. Therefore, ETA5071 is an ideal power supply for low power applications such as IoT, wearables and fingerprint lock, etc.

ETA5071 is available in DFN1x1-4 and SOT23-5.

FEATURES

- ◆ High PSRR, 69dB at 100Hz, 62dB at 1KHz, 48dB at 1MHz
- ◆ 1uA ultra-low Iq
- ◆ 300mA output current
- ◆ Stable with a Wide Range of Ceramic Cap
- ◆ 120mV dropout voltage for 100mA at V_{OUT}=2.8V

APPLICATIONS

- ◆ NB-IoT module
- ◆ Wearables
- ◆ Fingerprint lock

FUNCTIONAL BLOCK DIAGRAM

FUNCTIONAL DESCRIPTION

The ETA5071 family of LDO regulators has been optimized for application in low standby power equipment. The device features ultra-low quiescent current, and 5V input voltage with 300mA output current capability.

Enable Sequence

ETA5071 is enabled when all below conditions happen. Otherwise, ETA5071 is in standby mode.

- ◆ EN pin voltage above logic High level
- ◆ Junction Temperature is not at Over-Temperature Protection level.

Once all above conditions happen, ETA5071 first enables BANDGAP and BIAS then enables LDO core.

ETA5071 is in shutdown mode when EN pin is pulled below logic low level threshold. The shutdown current is less than 0.3uA in at that time. Otherwise, part only shutdown the VOUT while other circuit still in operation. Once ETA5071 is in shutdown conditions, Output is discharged by 60Ω resistor (optional).

Output Current Limit and Foldback Current Limit

ETA5071 family features an internal current limit. In normal operation, the ETA5071 limits output current to approximately 500mA. When current limiting engages, the output voltage scales back linearly until the over current condition ends.

In case output is in hard short conditions, ETA5071 also features an internal foldback limit that reduces the output current limit to a lower level, 120mA, then reduce power dissipation ratings of the package.

Over-Temperature Protection

Thermal protection disables the output when the junction temperature rises to approximately 170°C, allowing the device to cool down. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits regulator dissipation, protecting the device from damage as a result of overheating.
