## **Application Information**

### **Output Voltage Setting**

The EA2208 output voltage can be set via a resistor divider (R1, R2). The output voltage is calculated by following equation:

$$V_{OUT} = 0.6 \times \frac{R1}{R2} + 0.6 \text{ V}$$

### **Input / Output Capacitors Selection**

The input capacitors are used to suppress the noise amplitude of the input voltage and provide a stable and clean DC input to the device. Because the ceramic capacitor has low ESR characteristic, so it is suitable for input capacitor use. It is recommended to use X5R or X7R MLCC capacitors in order to have better temperature performance and smaller capacitance tolerance. In order to suppress the output voltage ripple, the MLCC capacitor is also the best choice. The suggested value of input / output capacitors are 22uF.

### **Inductor Selection**

The recommended values of inductor are 4.7uH to 10uH. Small size and better efficiency are the major concerns for portable device. The inductor should have low core loss at 1.2MHz and low DCR for better efficiency. To avoid inductor saturation, the current rating should be considered.

### **Diode Selection**

Schottky diodes with low forward voltages are recommended for EA2208. Ensure the diode current rating exceed the output current and the peak inductor current. The diode's reverse breakdown voltage should be larger than the output voltage.

### **PCB Layout Recommendations**

For EA2208 PCB layout considerations, please refer to the following suggestions in order to get good performance.

- ▶ High current path traces need to be widened.
- ▶ Place the input and output capacitors as close as possible to the device to reduce noise interference.
- ▶ The GND pin should be connected to a large area ground plane
- ▶ Keep the feedback path (from V<sub>OUT</sub> to FBK) away from the noise node (ex. SWITCH).
