Application Information

Enable Control

The EA8211 use RUN pin to control the regulator turns on / turns off. When the RUN pin input voltage is higher than 2V, the EA8211 enters the operating mode. Drive the RUN pin input voltage lower than 0.4V to ensure the EA8211 into shutdown mode, as shown in Figure3. When the device works in the shutdown mode, the shutdown supply current is about 1uA. The EA8211 also provides automatic startup function as shown in Figure 4. Connect RUN pin and PWR pin with a 100KΩ resistor, when the PWR supply input voltage increasing and higher than RUN pin threshold voltage, the EA8211 will enter operating mode automatically.

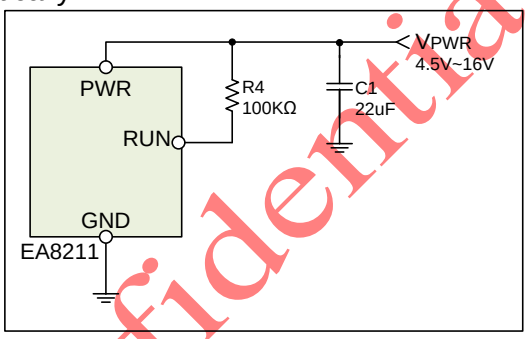

Figure 4. Automatic startup application circuit

Output Voltage Setting

The EA8211 output voltage can be set via a resistor divider (R1, R2). The output voltage is calculated by following equation:

$$V_{OUT} = 0.8 \times \frac{R1}{R2} + 0.8\ V$$

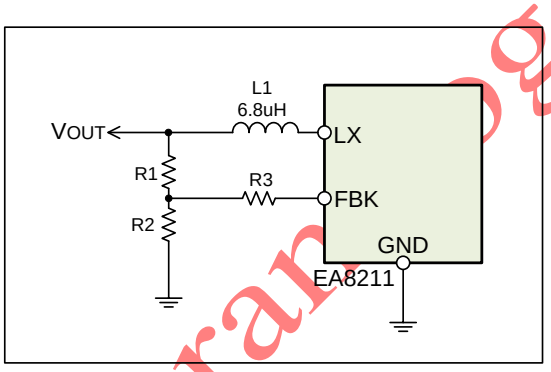

Figure 5. Feedback Network

Taking into account the loop stability, R1 resistance value must be greater than 100KΩ. The following table lists common output voltage and the corresponding R1, R2, R3 resistance value for reference.

Output Voltage	R1 Resistance	R2 Resistance	R3 Resistance	Tolerance
5V	120KΩ	22KΩ	51KΩ	1%
3.3V	150KΩ	47KΩ	51KΩ	1%
1.8V	150KΩ	120KΩ	75KΩ	1%
1.2V	100KΩ	200KΩ	120KΩ	1%

Input / Output Capacitors Selection

The input capacitors are used to suppress the noise amplitude of the input voltage and provide a stable and clean DC input to the device. Because the ceramic capacitor has low ESR characteristic, so it is suitable for input capacitor use. It is recommended to use X5R or X7R MLCC capacitors in order to have better temperature performance and smaller capacitance tolerance. In order to suppress the output voltage ripple, the MLCC capacitor is also the best choice. The suggested part numbers of input / output capacitors are as follows:

Vendor	Part Number	Capacitance	Edc	Parameter	Size
TDK	C3225X5R1C226M	22uF	16V	X5R	1210
TDK	C2012X5R0J226K	22uF	6.3V	X5R	0805
TDK	C3216X5R1A226M	22uF	10V	X5R	1206

Output Inductor Selection

The output inductor selection mainly depends on the amount of ripple current through the inductor ΔI_L. Large ΔI_L will cause larger output voltage ripple and loss, but the user can use a smaller inductor to save cost and space. On the contrary, the larger inductance can get smaller ΔI_L and thus the smaller output voltage ripple and loss. But it will increase the space and the cost. The inductor value can be calculated as:

$$L = \frac{V_{PWR} - V_{OUT}}{\Delta I_L \times F_{SW}} \times \frac{V_{OUT}}{V_{PWR}}$$

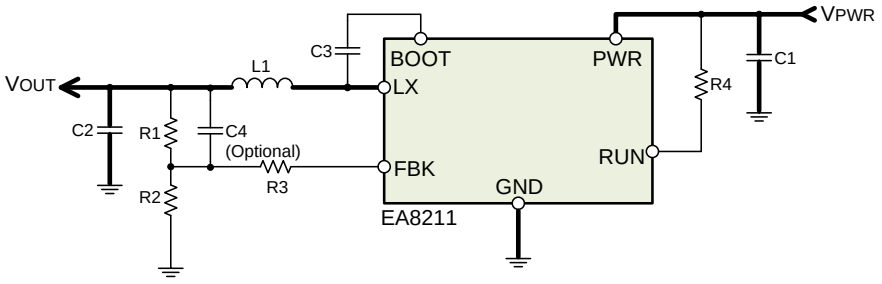
For most applications, 4.7uH to 10uH inductors are suitable for EA8211. The suggested part numbers of output inductors are as follows:

Vendor	Part Number	Inductance	DCR (Max.)	Saturation Current	Dimensions (mm) (WxLxH)
SUMIDA	CDRH8D38-4R7	4.7uH	29mΩ	4A	8x8x3.8
SUMIDA	CDRH8D43R-6R8	6.8uH	29.8mΩ	4.2A	8.3x8.5x4.5

PCB Layout Recommendations

For EA8211 PCB layout considerations, please refer to the following suggestions in order to get good performance.

- High current path traces (shown as below) need to be widened.
- Place the input capacitors as close as possible to the PWR pin to reduce noise interference.
- Keep the feedback path (from V_{OUT} to FBK) away from the noise node (ex. LX).
- LX is a high current noise node. Complete the layout by using short and wide traces.



* Bold lines indicate high current paths
