## Low-Power Hall Switch

## General Description

FD2H001B is a low-power integrated Hall switch designed to sense the applied magnetic flux density and give a digital output, which indicates the present condition of the magnitude sensed. One example of the applications is the on/off switch in cellular flip-phones.

The micro power design is especially suitable for battery-operated systems such as cellular phones or laptop computers, in which power consumption is one major concern. The typical power consumption of FD2H001B is below $10 \mu \mathrm{~W}$ at 2.7 V .

The magnetic switching points are precise and insensitive to process and temperature variations.
For FD2H001B, the output will be at the "low" level if the applied magnetic flux density is stronger than the switching threshold.

For detailed magnetic flux direction please refer to the figure. 3

## Features

> Micro power consumption
> 2.4 V to 5.5 V battery operation
> Chopper Amplifier based design:
Insensitive to noise and offset caused by process variations, operating temperatures and mechanical stress
> Digital output
> Programmable output direction
> CMOS process
> Available in SOT-23L/ TSOT-23L/SIP-3L package

## Marking Information

## SOT-23L/ TSOT-23L

Lot Number: Wafer lot number's last two digits
For Example: XX686 $\rightarrow 86$
Year: Production year's last digit
Part Number Code: Part number identification code for this product.

SIP-3L

Internal ID: Internal Identification Code
Per-Half Month: Production period indicator in half month time unit
For Example : A $\rightarrow$ First Half Month of January
B $\rightarrow$ Second Half Month of January
C $\rightarrow$ First Half Month of February
D $\rightarrow$ Second Half Month of February
Year: Production year's last digit

## Block Diagram

Figure. 1

## Functional Descriptions

Refer to the block diagram (Figure.1), FD2H001B is composed of the following building blocks:

- Bias generator

The bias generator provides precise, temperature and process insensitive current sources for both the Hall plate and the chopper amplifier. These current sources in turn guarantee proper operation of the chip and precise switching thresholds under all kinds of environments specified in the specification.

- Oscillator + Sequencer

The built-in oscillator provides the clock signal, which is taken by the sequencer to determine the periods of the operating phase and the stand-by phase. Typically the operating time is about 60us and the stand-by time is 150 ms . Using such a clocking scheme, the average power consumption is almost equal to that in the stand-by phase, which is under $10 \mu \mathrm{~W}$ at 2.7 V .

- Power on Reset

Used to detect the power-up ramp and reset the digital circuits to attain correct operation as soon as the power is ready.

- Chopper Amplifier

To achieve a higher resolution the chopper amplifier structure is adopted in this design. Use of this structure dynamically removes both the offset and flicker noise at the same time.

- Hysteresis Control

This block determines the switching threshold of the Hall switch in different situations.

## Ordering information

| Part Number | Operating Temperature | Package | Description | MOQ |
| :---: | :---: | :---: | :---: | :---: |
| FD2H001BaR-G1 | $-20{ }^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | TSOT23 | $\pm 50 \mathrm{G}(\mathrm{B})$ | $3,000 \mathrm{ea} / \mathrm{Reel}$ |
| FD2H001BYR-G1 | $-20{ }^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | SOT23 | $\pm 50 \mathrm{G}(\mathrm{B})$ | $3,000 \mathrm{ea} / \mathrm{Reel}$ |
| FD2H001BH-LF | $-20{ }^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$ | SIP-3L | $\pm 50 \mathrm{G}(\mathrm{B})$ | $1,000 \mathrm{ea} / \mathrm{Bag}$ |

## Absolute Maximum Ratings

| Parameter |  | Conditions | Values |  |
| :--- | :---: | :---: | :---: | :---: |
