confidential for succession **1. INTRODUCTION**

1.1. General Description

The FORESEE FSNAND is offered in 3.3 VCC with x8 I/O interface. Its NAND cell provides the most cost-effective solution for the solid state application market. The I/O pins serve as the ports for address and data input/output as well as command input. The on-chip write controller automates all program and erase functions including pulse repetition, where required, and internal verification and margining of data.

1.6. Pin Description

[Table 2] Pin Descr	iption
Pin Name	Pin Function
$I/O_0 \sim I/O_7$	DATA INPUTS/OUTPUTS The I/O pins are used to input command, address and data, and to output data during read operations. The I/O pins float to high-z when the chip is deselected or when the outputs are disabled.
CLE	COMMAND LATCH ENABLE The CLE input controls the activating path for commands sent to the command register. When active high, commands are latched into the command register through the I/O ports on the rising edge of the WE# signal.
ALE	ADDRESS LATCH ENABLE The ALE input controls the activating path for address to the internal address registers. Addresses are latched on the rising edge of WE# with ALE high.
CE#	CHIP ENABLE The CE# input is the device selection control. When the device is in the Busy state, CE# high is ignored, and the device does not return to standby mode in program or erase operation.
RE#	READ ENABLE The RE# input is the serial data-out control, and when active drives the data onto the I/O bus. Data is valid t _{REA} after the falling edge of RE# which also increments the internal column address counter by one.
WE#	WRITE ENABLE The WE# input controls writes to the I/O port. Commands, address and data are latched on the rising edge of the WE# pulse.
WP#	WRITE PROTECT The WP# pin provides inadvertent program/erase protection during power transitions. The internal high voltage generator is reset when the WP# pin is active low.
R/B#	READY/BUSY OUTPUT The R/B# output indicates the status of the device operation. When low, it indicates that a program, erase or random read operation is in process and returns to high state upon completion. It is an open drain output and does not float to high-z condition when the chip is deselected or when outputs are disabled.
VCC	POWER VCC is the power supply for device.
VSS	GROUND
NC	NO CONNECTION

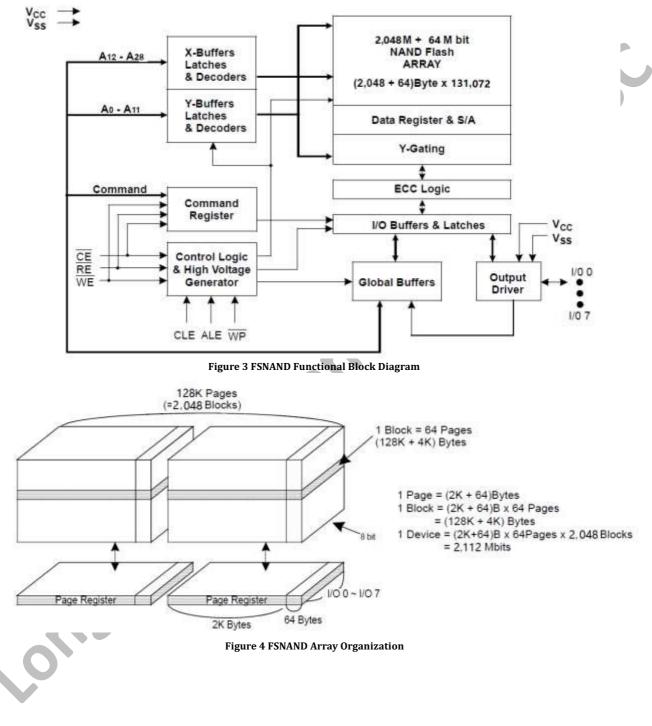

NOTE:

Connect all V_{CC} and V_{SS} pins of each device to common power supply outputs.

ECC Read Status	7Ah		

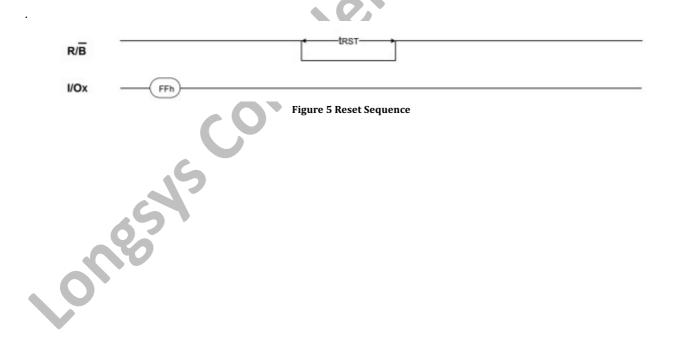

NOTE :

1) Random Data Input/Output can be executed in a page.

2) Any command between 11h and 81h is prohibited except 70h and FFh.

2.2. Reset Operation

The reset command FFh resets the read/program/erase operation and clear the status register to be C0h (when WP# is high). The reset command during the program/erase operation will result in the content of the selected locations (perform programming/erasing) might be partially programmed/erased. If the Flash memory has already been set to reset stage with reset command, the additional new reset command is invalid.

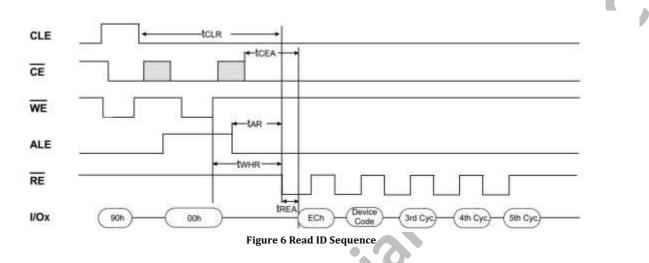

2.3. Read ID

The device contains a product identification mode, initiated by writing 90h to the command register, followed by an address input of 00h.

For the FORESEE device, five read cycles sequentially output the 1st Cycle, and the device code and 3rd, 4th, and 5th cycle ID, respectively. The command register remains in Read ID mode until further commands are issued to it.

Rev 1.1

2.4. Page Read Operation

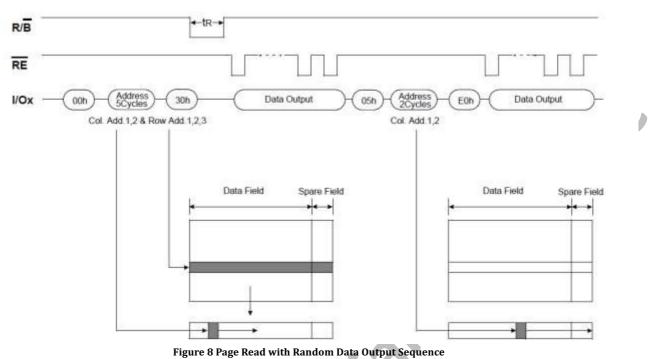

The device array is accessed in Page of 2,112 bytes. External reads begins after the R/B# pin goes to READY. The Read operation may also be initiated by writing the 00h command and giving the address (column and row address) and being confirmed by the 30h command, the device begins the internal read operation and the chip enters busy state. The data can be read out in sequence after the chip is ready.

The device may output random data in a page instead of the consecutive sequential data by writing random data output command. The column address of next data, which is going to be out, may be changed to the address which follows random data output command. Random data output can be operated multiple times regardless of how many times it is done in a page.

Rev 1.1

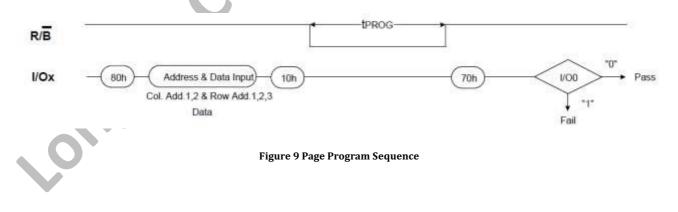

2.5. Page Program Operation

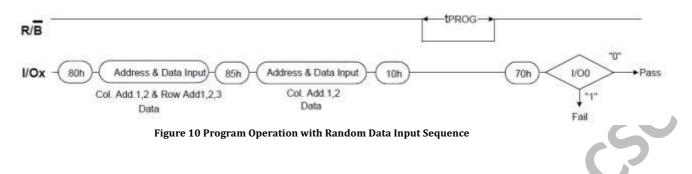

The device is programmed basically on a page basis, and each page shall be programmed only once before being erased. The memory is programmed by page, which is 2,112 bytes. After Program load command (80h) is issued and the row and column address is given, the data will be loaded into the chip sequentially. Random Data Input command (85h) allows multiple data load in non-sequential address. After data load is complete, program confirm command (10h) is issued to start the page program operation. The page program operation in a block should start from the low address to high address.

Once the program process starts, the Read Status Register command may be entered to read the status register. The system controller can detect the completion of a program cycle by monitoring the R/B# output, or the Status bit (I/O6) of the Status Register. When the Page Program is complete, the Write Status Bit (I/O0) may be checked (Figure 9). The internal write verify detects only errors for "1"s that are not successfully programmed to "0"s.

During the Page Program progressing, only the read status register command and reset command are accepted, others are ignored.

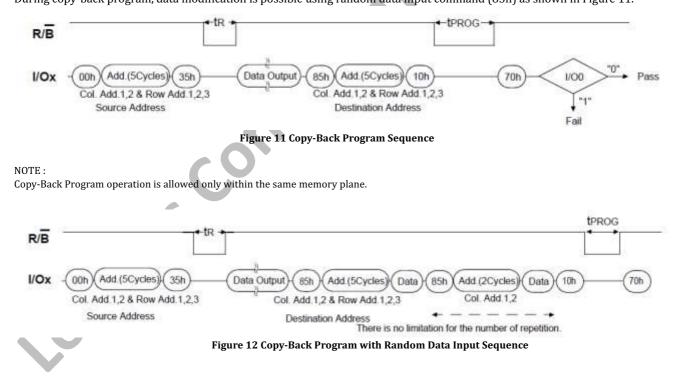

2.6. Copy-Back Program Operation

Copy-Back program with Read for Copy-Back is configured to quickly and efficiently rewrite data stored in one page. The benefit is especially obvious when a portion of a block is updated and the rest of the block also needs to be copied to the newly assigned free block. Copy-Back operation is a sequential execution of Read for Copy-Back and of copy-back program with the destination page address. A read operation with "35h" command and the address of the source page moves the whole 2,112-byte data into the internal data buffer. A bit error is checked by sequential reading the data output. In the case where there is no bit error, the data do not need to be reloaded. Therefore Copy-Back program operation is initiated by issuing Page-Copy Data-Input command (85h) with destination page address. Actual programming operation begins after Program Confirm command (10h) is issued. Once the program process starts, the Read Status Register command (70h) may be entered to read the status register. The system controller can detect the completion of a program cycle by monitoring the R/B# output, or the Status bit (I/O6) of the Status Register remains in Read Status command mode until another valid command is written to the command register. During copy-back program, data modification is possible using random data input command (85h) as shown in Figure 11.

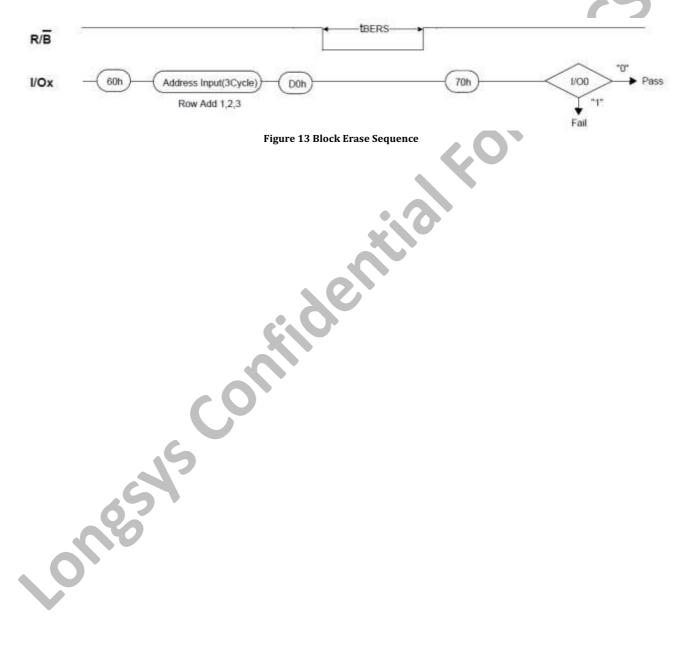

Rev 1.1

2.7. Block Erase Operation

The Erase operation is done on a block basis. Block address loading is accomplished in three cycles initiated by an Erase Setup command (60h). Only address A18 to A28 is valid while A12 to A17 is ignored. The Erase Confirm command (D0h) following the block address loading initiates the internal erasing process. This two-step sequence of setup followed by execution command ensures that memory contents are not accidentally erased due to external noise conditions.

The completion of the erase operation can be detected by R/B# pin or Status register bit (IO6). Recommend to check the status register bit IO0 after the erase operation completes.

During the erasing process, only the read status register command and reset command can be accepted, others are ignored.

2.8. Unaligned Two-Plane Operation

Two-Plane Read/Program operation is supported in unaligned block addresses, as long as page addresses are same in all planes.

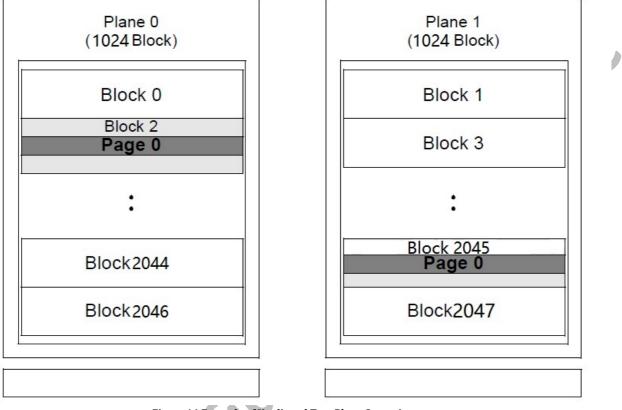

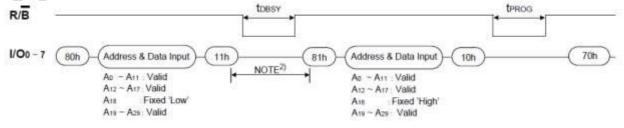

Figure 14 Example of Unaligned Two-Plane Operation

2.9. Two-Plane Page Program Operation

Two-Plane Page Program is an extension of Page Program, for a single plane with 2112 byte page registers. Since the device is equipped with two memory planes, activating the two sets of 2112 byte page registers enables a simultaneous programming of two pages. After writing the first set of data up to 2112 byte into the selected page register, Dummy Page Program command (11h) instead of actual Page Program command (10h) is inputted to finish data-loading of the first plane. Since no programming process is involved, R/B# remains in Busy state for a short period of time (tDBSY). Read Status command (70h) may be issued to find out when the device returns to Ready state by polling the Ready/Busy status bit (I/O 6). Then the next set of data for the other plane is inputted after the 81h command and address sequences. After inputting data for the last plane, actual True Page Program (10h) instead of dummy Page Program command (11h) must be followed to start the programming process. The operation of R/B and Read Status is the same as that of Page Program. Although two planes are programmed simultaneously, pages/fail is not available for each page when the program operation completes. Status bit of I/O 0 is set to "1" when any of the pages fails.

NOTE :

It is noticeable that same row address except for A18 is applied to the two blocks.
 Any command between 11h and 81h is prohibited except 70h and FFh.

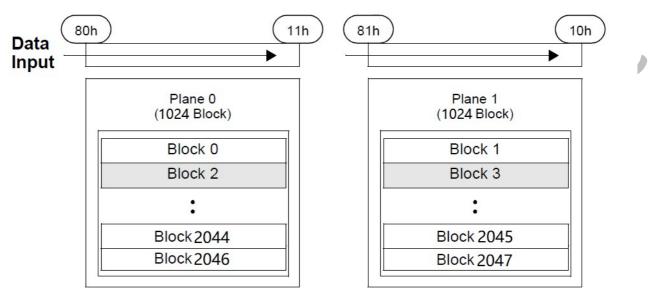

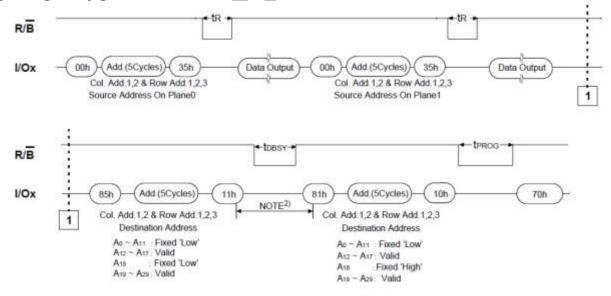

Figure 15 Two-Plane Page Program Sequence

2.10. Two-Plane Copy-Back Program Operation

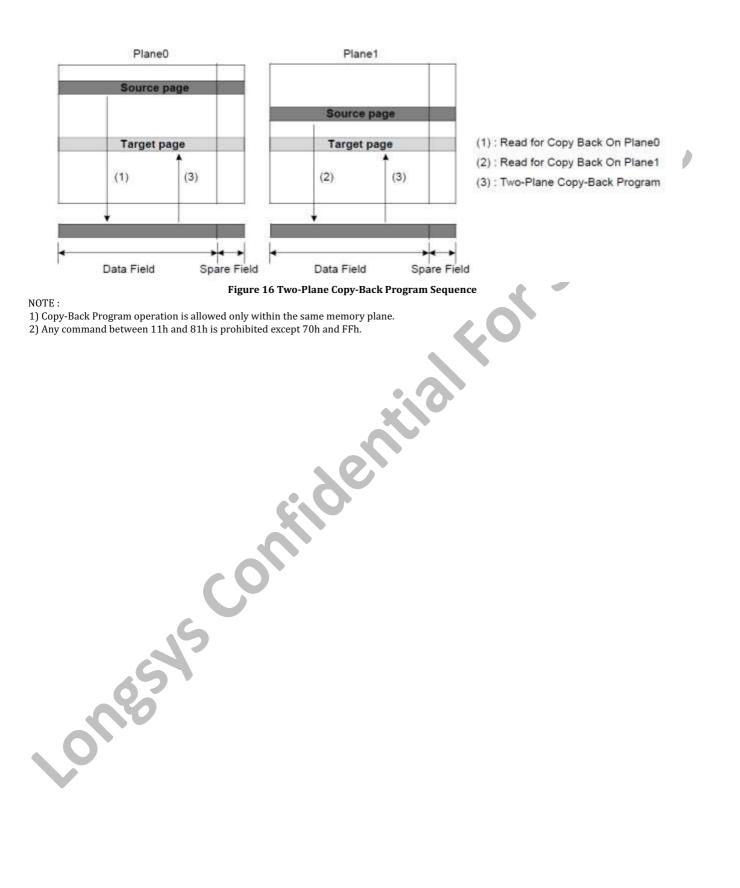

Two-Plane Copy-Back Program is an extension of Copy-Back Program, for a single plane with 2112 byte page registers. Since the device is equipped with two memory planes, activating the two sets of 2112 byte page registers enables a simultaneous programming of two pages.

FORESEE®

FS33ND02GS2

Rev 1.1

Rev 1.1

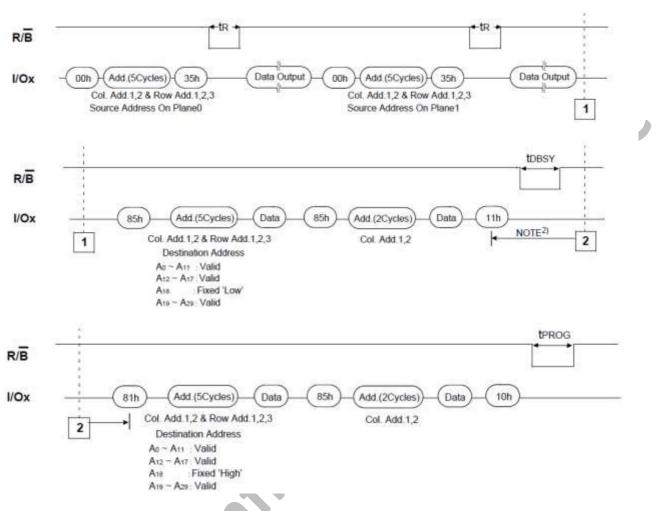

Figure 17 Two-Plane Copy-Back Program Operation with Random Data Input Sequence

NOTE :

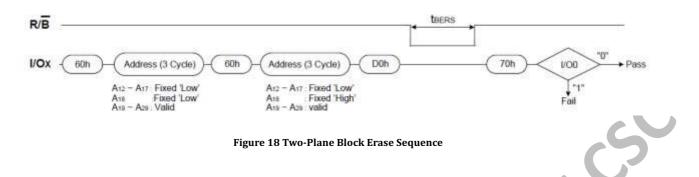

1) Copy-Back Program operation is allowed only within the same memory plane. 2) Any command between 11h and 81h is prohibited except 70h and FFh.

2) Any command between 11h and 81h is prohibited except 70h and FFh.

2.11. Two-Plane Block Erase Operation

Basic concept of Two-Plane Block Erase operation is identical to that of Two-Plane Page Program. Up to two blocks, one from each plane can be simultaneously erased. Standard Block Erase command sequences (Block Erase Setup command (60h) followed by three address cycles) may be repeated up to twice for erasing up to two blocks. Only one block should be selected from each plane. The Erase Confirm command (D0h) initiates the actual erasing process. The completion is detected by monitoring R/B pin or Ready/Busy status bit (I/O6).

2.12. Read Status

The device provides a status register that outputs the device status by writing a command code 70h, and then the IO pins output the status at the falling edge of CE# or RE# which occurs last. Even though when multiple flash devices are connecting in system and the R/B# pins are common-wired, the two lines of CE# and RE# may be checked for individual devices status separately. The command register remains in Read Status mode until further commands are issued to it. Therefore, if the status register is read during a random read cycle, the read command (00h) should be given before starting read cycles.

[Table 9] 3	Table 9] Status Register Definition for 70h Command

[Table 9] Status Register Definition for 70h Command

NOTE :

I/Os defined 'Not use' are recommended to be masked out when Read Status is being executed.

2.13. ECC Read Status

Using the ECC Read Status function, the Error Correction Status can be identified. ECC is performed on the NAND Flash main and spare areas. The ECC Read Status function also shows the number of errors in a sector as identified from a ECC check during a read operation.

[Table 10] ECC Status Bytes

I/07	I/06	I/05	I/04	I/03	I/02	I/01	I/00
Sector Inform	ation			ECC Status			

[Table 11] ECC Status

[]

0001	2nd Sector (Main and Spare area)
0010	3rd Sector (Main and Spare area)
0011	4th Sector (Main and Spare area)
Others	Reserved

2.14. ECC Sector Information

ECC is generated by internal ECC logic during program operation.

During Read operation, the device automatically executes ECC. After read operation is executed, read status command can be issued to identify the read status the read status remains unmodified until other valid commands are executed.

enti

[Table 13] 2KByt	e Page Assignme	nt					
1'st Main	2'nd Main	3'rd Main	4'th Main	1'st Spare	2'nd Spare	3'rd Spare	4'th Spare
512B	512B	512B	512B	16B	16B	16B	16B

[Table 14]Definition of 528Byte Sector

Sector	Column Address (Byte)				
	Main Field	Spare Field			
1'st Sector	0 ~ 511	2,048 ~ 2,063			
2'nd Sector	512 ~ 1,023	2,064 ~ 2,079			
3'rd Sector	1,024 ~ 1,535	2,080 ~ 2,095			
4'th Sector	1,536 ~ 2,047	2,096 ~ 2,111			

NOTE :

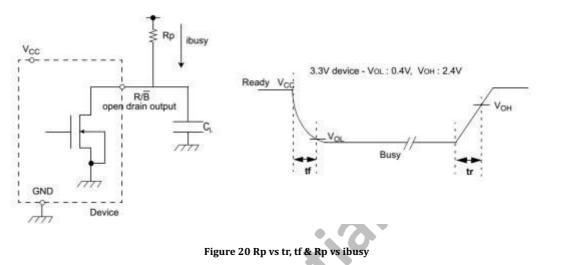

The Internal ECC manages all data of Main area and Spare area.

A sector is the minimum unit for program operation and the number of program per page must not exceed 1.

2.15. Ready/Busy

The R/B# is an open-drain output pin and a pull-up resistor is necessary to add on the R/B# pin. The R/B# outputs the ready/busy status of read/program/ erase operation of the device. When the R/B# is at low, the device is busy for read or program or erase operation. When the R/B# is at high, the read/program/erase operation is finished.

Rp Value Guidence

The rise time of the R/B# signal depends on the combination of Rp and capacitive loading of the R/B# circuit. It is approximately two times constants (Tc) between the 10% and 90% points on the R/B# waveform. T_c = R × C

Where R = Rp (Resistance of pull-up resistor), and $C = C_L$ (Total capacitive load)

The fall time of the R/B# signal majorly depends on the output impedance of the R/B# signal and the total load capacitance.

Notes:

Considering of the variation of device-by-device, the above data is for reference to decide the resistor value. Rp maximum value depends on the maximum permissible limit of tr. IL is the total sum of the input currents of all devices tied to the R/B pin.

3. Electrical Characteristic

3.1. Valid Block

[Table 15] The Number of Valid Block

Parameter	Symbol	Min	Тур.	Max	Unit
FS33ND02GS2	NVB	2,008	-	2,048	Blocks

3.2. Recommended Operating Conditions

[Table 16] Recommended Operating Conditions

Parameter	Symbol	Min	Тур.	Мах	Unit
Power Supply Voltage	VCC	2.7	3.3	3.6	v
Ground Supply Voltage	VSS	0	0	0	V

3.3. Absolute Maximum DC Ratings

[Table 17] Absolute Maximum Ratings

0	C	1105
Symbol	Rating	Unit
VCC	-0.6 to + 4.6	
VIN	-0.6 to + 4.6	V
VI/O	-0.6 to VCC + 0.3 (< 4.6V)	
TBIAS	-40 to +85	°C
	VCC VIN VI/O	Symbol Rating VCC -0.6 to + 4.6 VIN -0.6 to + 4.6 VI/O -0.6 to VCC + 0.3 (< 4.6V)

NOTE :

Minimum DC voltage is -0.6V on input/output pins. During transitions, this level may undershoot to -2.0V for periods <30ns.

Maximum DC voltage on input/output pins is VCC+0.3V which, during transitions, may overshoot to VCC+2.0V for periods <20ns.

Permanent device damage may occur if Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet.

Exposure to absolute maximum rating conditions for extended periods may affect reliability.

3.4. DC Operating Characteristics

Parameter	Symbol	Test Conditions	Min	Тур	Max	Unit	
Page Read Access Operation Current	ICC1	tRC=50ns CE#=VIL, IOUT=0mA	-	45	22

Output Low Current (R/B#)	IOL(R/B #)	VOL=0.4V	8	10	-	mA	

[Table 18] DC & Operating Characteristics

NOTE :

VIL can undershoot to -0.4V and VIH can overshoot to VCC +0.4V for durations of 20ns or less. Typical

value is measured at VCC=3.3V, TA=25 °C. Not 100% tested.

Rev 1.1

3.5. Input / Output Capacitance (TA=25°C, VCC=3.3V, f=1.0Mhz)

[Table 19] Input / Output Capacitance

Item	Symbol	Test Condition	Min	Max	Unit
Input/Output Capacitance	Ci/o	V _{IL} =0V	-	8	pF
Input Capacitance	Cin	V _{IN} =0V	-	8	pF

3.6. Read / Program / Erase Characteristics

[Table 20] NAND Read / Program / Erase Characteristics

NOTE : Capacitance is periodically sampled and not 100% te				C	5		
3.6. Read / Program / Erase Characteristics [Table 20] NAND Read / Program / Erase Characteristics							
Parameter	Symbol	Min	Тур	Max	Unit		
Data Transfer from Cell to Register	tR	-		25	μs		
Program Time	tPROG	-	400	900	μs		
Dummy Busy Time for Two-Plane Page Program	tDBSY		0.5	1	μs		
Number of Partial Program Cycles	Nop	- (1	cycles		
Block Erase Time	tBERS	-	4.5	16	ms		

NOTE :

Typical value is measured at VCC=3.3V, $T_A{=}25\,^\circ\!\mathrm{C}$. Not 100% tested.

Typical program time is defined as the time within which more than 50% of the whole pages are programmed at 3.3V VCC and 25 °C temperature.

3.7. AC Timing Parameters Table

Parameter	Symbol	Min	Max	Unit
CLE Setup Time	tCLS ¹⁾	12	-	ns
CLE Hold Time	tCLH	5	-	ns
CE# Setup Time	tCS1)	20	-	ns
CE# Hold Time	tCH	5	-	ns

RE# High to WE# Low	tRHW	100	-	ns
WE# High to RE# Low	tWHR	60	-	ns
Device Resetting Time (Read/Program/Erase)	tRST	-	5/10/500 ¹⁾	μs

NOTE :

1) The transition of the corresponding control pins must occur only once while WE# is held low.

2) t_{ADL} is the time from the WE# rising edge of final address cycle to the WE# rising edge of first data cycle. 3) If reset

command(FFh) is written at Ready state, the device goes into Busy for maximum 5 μ s.

4. NAND FLASH TECHNICAL NOTES

4.1. Initial Invalid Block(s)

onests

The initial invalid blocks are included in the device while it gets shipped called. Devices with initial invalid block(s) have the same quality level as devices with all valid blocks and have the same AC and DC characteristics. During the time of using the device, the additional invalid blocks might be increasing; therefore, it is recommended to check the invalid block marks and avoid using the invalid blocks. Furthermore, please read out the initial invalid block and the increased invalid block information before any erase operation since it may be cleared by any erase operation.

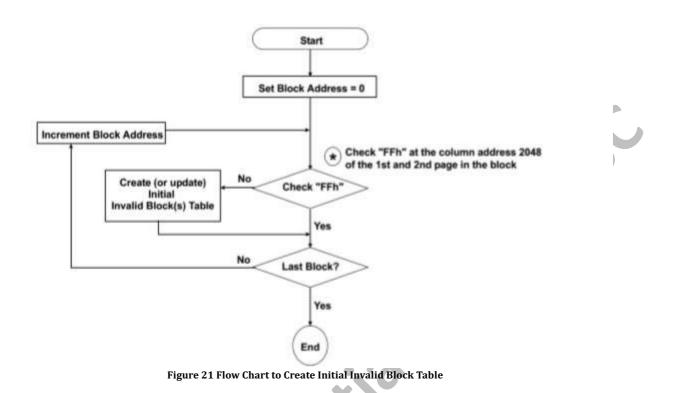

4.2. Identifying Initial Invalid Block(s)

While the device is shipped, the value of all data bytes of the good blocks are FFh. The initial invalid block(s) status is defined by the 1st byte in the spare area. Longsys makes sure that either the 1st or 2nd page of every initial invalid block has non-FFh data at the column address of 2048.

Therefore, the system must be able to recognize the initial invalid block(s) based on the original initial invalid block information and create the initial invalid block table via the following suggested flow chart. The erase operation at the invalid block is not recommended.

4.3. Error in Write or Read Operation

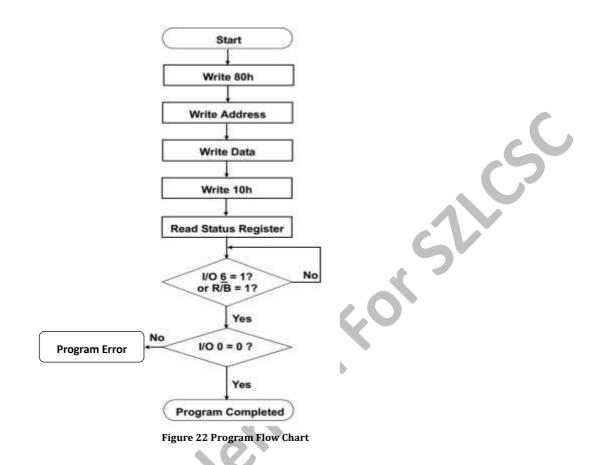

The device may fail during a Read, Program or Erase operation. The following possible failure modes should be considered when implementing a highly reliable system. Block replacement should be done while status read failure after erase or program. Because program status fail during a page program does not affect the data of the other pages in the same block, block replacement can be executed with a page-sized buffer by finding an erased empty block and reprogramming the current target data and copying the rest of the replaced block. In case of Read, ECC must be employed. To improve the efficiency of memory space, it is recommended that the read or verification failure due to single bit error be reclaimed by ECC without any block replacement. The said additional block failure rate does not include those reclaimed blocks. **[Table 22] Failure Cases**

Ē	Failure Mode	Detection and Countermeasure Sequence
	Erase Failure	Read Status after Erase> Block Replacement
Write	Program Failure	Read Status after Program> Block Replacement
Read	Single bit Failure	Verify ECC -> ECC Correction

ECC:

Error Correcting Code --> Hamming Code etc. Example) 1bit correction & 2bit detection

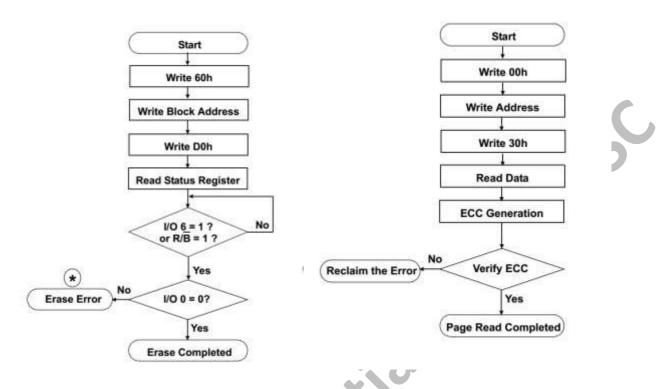

If program operation results in an error, map out the block including the page in error and copy the target data to another block.

onests

Rev 1.1

*If erase operation results in an error, map out the failing block and replace it with another block.

Figure 23 Erase Flow Chart& Read Flow Chart

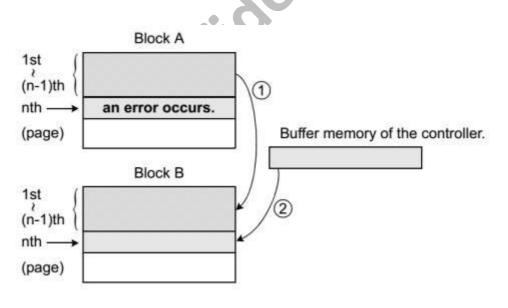

Figure 24 Block Replacement

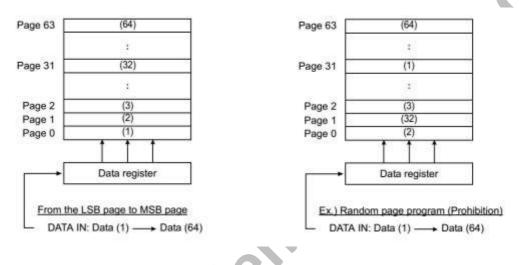

When an error happens in the nth page of the Block 'A' during erase or program operation.
 Copy the data in the 1st ~ (n-1)th page to the same location of another free block. (Block'B')
 Then, copy the nth page data of the Block 'A' in the buffer memory to the nth page of the Block'B'.

4. Do not erase or program to Block 'A' by creating an 'invalid block' table or other appropriate scheme.

4.4. Addressing for Program Operation

Within a block, the page program operation in a block should start from the low address to high address. Random page address programming is prohibited. In this case, the definition of LSB page is the LSB among the pages to be programmed. Therefore, LSB doesn't need to be page 0.

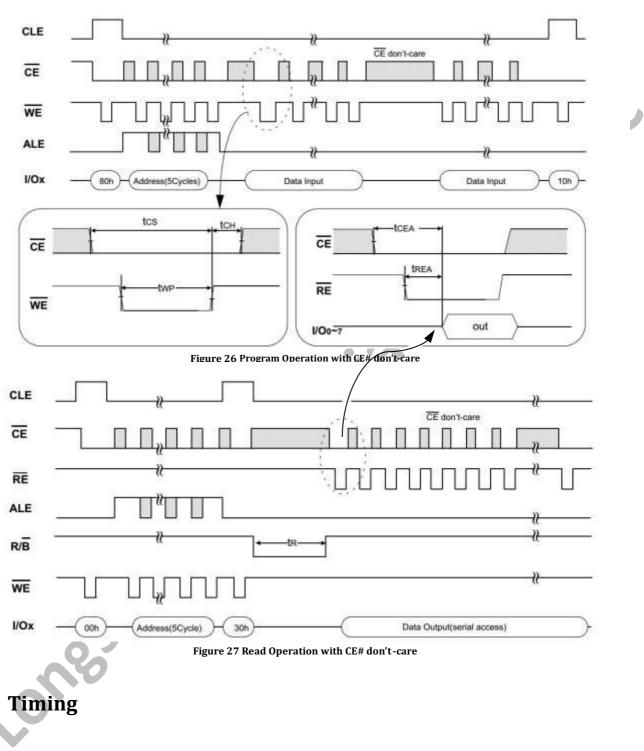

[Table 23]Address Information								
Device	I/0	DATA	ADDRESS					
	I/Ox	Data In/Out	Col. Add1	Col. Add2	Row Add1	Row Add2	Row Add3	
FS33ND02GS208TFI0	$I/0_0 \sim I/0_7$	2112Byte	A0~A7	A8~A11	A12~A19	A20~A27	A28~A28	
FS33ND02GS208BFI0	I/O 0 ~ I/O 7	2112Byte	A0~A7	A8~A11	A12~A19	A20~A27	A28~A28	

4.5. System Interface Using CE# Don't-Care

For an easier system interface, CE# may be inactive during the data-loading or serial access as shown below. The internal 2,112 byte data registers are utilized as separate buffers for this operation and the system design gets more flexible. In addition, for voice or audio applications which use slow cycle time on the order of μ -seconds, deactivating CE# during the data-loading and serial access would provide significant savings in power consumption.

Rev 1.1

5.1. Data Protection & Power Up Sequence

The device is designed to offer protection from any involuntary program/erase during power-transitions. An internal voltage detector disables all functions whenever VCC is below about 2V (3.3V device). WP# pin provides hardware protection and is recommended to be kept at VIL during power-up and power-down. A recovery time of minimum 1ms is required before internal

5.

circuit gets ready for any command sequences as shown in Figure 28. The two step command sequence for program/erase provides additional software protection.

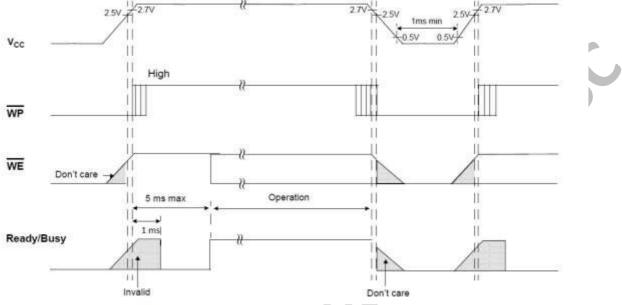

Figure 28 AC Waveforms for Power Transition

NOTE :

- 1) During the initialization, the device consumes a maximum current of 30mA (ICC1).
- 2) Once Vcc drops under 2.5V, Vcc is recommended that it should be driven down to 0.5V and stay low under 0.5V for at least 1ms before Vcc power up.

5.2. Mode Selection

CLE	ALE	CE#	WE#	RE#	WP#	Mode
