**[Table 3-5] MTBF Specifications**

MTBF is Mean Time Between Failure. As same word, annual failure ratio is 0.4%.

### 3.6 Endurance

TBW		
256GB	512GB	1TB
768TB	1536TB	3072TB

**[Table 3-7] Endurance Specifications**

Notes:

1-TBW (Terabytes Written) is a measurement of SSDs' expected lifespan, which represents the amount of data written to the device. To calculate the TBW of a SSD, the following equation is applied:

$$TBW = [(NAND\ Endurance) \times (SSD\ Capacity)] / WAF$$

NAND Endurance: NAND endurance refers to the P/E (Program/Erase) cycle of a NAND flash.

SSD Capacity: The SSD capacity is the specific capacity in total of a SSD.

WAF: Write Amplification Factor (WAF) is a numerical value representing the ratio between the amount of data that a SSD controller needs to write and the amount of data that the host's flash controller writes. A better WAF, which is near 1, guarantees better endurance and lower frequency of data written to flash memory.

2-The above TBW values are calculated based on WAF=1.

3-TBW may differ according to flash configuration and platform.

4-The endurance of SSD could be estimated based on user behavior, NAND endurance cycles, and write amplification factor. It is not guaranteed by flash vendor.

### 3.7 Environmental Specifications

Features	Operating	Non-Operating
Temperature	0°C to 70°C	-40°C to 85°C
Humidity	5% to 95%, non-condensing	
Vibration	7~800Hz, 3.08Grms, 30min/axis(X,Y,Z)	
Shock	1500G, duration 0.5ms, Half Sine Wave	

**[Table 3-6] Power Consumption**

Notes:

- 1-Temperature is measured by SMART Temperature .Proper airflow recommended.
- 2-Humidity is measured in non-condensing
- 3-Test condition for shock: 0.5ms duration with half sine wave
- 4-Test condition for vibration: 10Hz to 2,000Hz, 15mins/axis on 3axis
