i.MX 6SoloLite Applications Processors for Consumer Products

Ordering Information

See [Table 1 on page 3](#)

1 Introduction

The i.MX 6SoloLite processor represents Freescale's latest achievement in integrated multimedia applications processors, which are part of a growing family of multimedia-focused products that offer high performance processing and are optimized for lowest power consumption.

The processor features Freescale's advanced implementation of the a single ARM Cortex™-A9 core, which operates at speeds up to 1 GHz. It includes 2D graphics processor and integrated power management. The processor provides a 32-bit DDR3-800 memory interface and a number of other interfaces for connecting peripherals, such as WLAN, Bluetooth™, GPS, hard drive, displays, and camera sensors.

The i.MX 6SoloLite processor is specifically useful for applications, such as:

- Color and monochrome eReaders
- Entry level tablets
- Barcode scanners

The i.MX 6SoloLite processor features:

- Applications processor—The processor enhances the capabilities of high-tier portable applications by fulfilling the ever increasing MIPS needs of operating systems and games. Freescale's Dynamic Voltage and Frequency Scaling (DVFS) provides significant power reduction, allowing the device to run at lower voltage and frequency with sufficient MIPS for tasks, such as audio decode.
- Multilevel memory system—The multilevel memory system of each processor is based on the L1 instruction and data caches, L2 cache, and internal and external memory. The processor supports many types of external memory devices, including DDR3, low voltage DDR3, LPDDR2, NOR Flash, PSRAM, cellular RAM, and managed NAND, including eMMC up to rev 4.4.
- Smart speed technology—The processor has power management throughout the IC that enables the rich suite of multimedia features and peripherals to consume minimum power in both active and various low power modes. Smart speed technology enables the designer to deliver a feature-rich product, requiring levels of power far lower than industry expectations.
- Dynamic voltage and frequency scaling—The processor improves the power efficiency of devices by scaling the voltage and frequency to optimize performance.
- Multimedia powerhouse—The multimedia performance of each processor is enhanced by a multilevel cache system, Neon MPE (Media Processor Engine) co-processor, and a programmable smart DMA (SDMA) controller.
- Powerful graphics acceleration—Each processor provides three independent, integrated graphics processing units: 2D BLit engine, a 2D graphics accelerator, and dedicated OpenVG™ 1.1 accelerator.
- Interface flexibility—The processor supports connections to a variety of interfaces: LCD controller, CMOS sensor interface (parallel), high-speed USB on-the-go with PHY, high-speed USB host PHY, multiple expansion card ports (high-speed MMC/SDIO host and other), 10/100 Mbps Ethernet controller, and a variety of other popular interfaces (such as UART, I²C, and I²S serial audio).
- Electronic Paper Display Controller—The processor integrates EPD controller that supports E-INK color and monochrome with up to 2048 x 1536 resolution at 106 Hz refresh, 4096 x 4096 resolution at 20 Hz refresh and 5-bit grayscale (32-levels per color channel). The processor also integrates an EPD controller that supports SiPix monochrome panels.
- Advanced security—The processor delivers hardware-enabled security features that enable secure e-commerce, digital rights management (DRM), information encryption, secure boot, and secure software downloads. The security features are discussed in detail in the i.MX 6SoloLite security reference manual. Contact your local Freescale representative for more information.
- Integrated power management—The processor integrates linear regulators and generate internally all the voltage levels for different domains. This significantly simplifies system power management structure.
- GPIO with interrupt capabilities—The new GPIO pad design supports configurable dual voltage rails at 1.8V and 3.3V supplies. The pad is configurable to interface at either voltage level.

1.1 Ordering Information

[Table 1](#) shows the orderable part numbers covered by this datasheet. [Table 1](#) does not include all possible orderable part numbers. The latest part numbers are available on freescale.com/imx6series. If your desired part number is not listed in [Table 1](#), or you have questions about available parts, see freescale.com/imx6series or contact your Freescale representative.

¹ Part numbers with a PC prefix indicate non-production engineering parts.

² Case 2240 is RoHS compliant, lead-free MSL (moisture sensitivity level) 3.

[Figure 1](#) describes the part number nomenclature so that users can identify the characteristics of the specific part number they have (for example, Cores, Frequency, Temperature Grade, Fuse options, Silicon revision).

Ensure that you have the right datasheet for your specific part by checking the Temperature Grade (Junction) field and matching it to the right datasheet. If you have questions, see freescale.com/imx6series or contact your Freescale representative.

1.2 Features

The i.MX 6SoloLite processor is based on ARM Cortex-A9 MPCore™ Platform, which has the following features:

- ARM Cortex-A9 MPCore CPU Processor (with TrustZone)
- The core configuration is symmetric, where each core includes:
 - 32 KByte L1 Instruction Cache
 - 32 KByte L1 Data Cache
 - Private Timer and Watchdog
 - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor

The ARM Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 256 KB unified I/D L2 cache
- Two Master AXI (64-bit) bus interfaces output of L2 cache
- Frequency of the core (including Neon and L1 cache) as per [Table 9, "Operating Ranges," on page 21](#)
- NEON MPE coprocessor
 - SIMD Media Processing Architecture
 - NEON register file with 32x64-bit general-purpose registers
 - NEON Integer execute pipeline (ALU, Shift, MAC)
 - NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
 - NEON load/store and permute pipeline

The memory system consists of the following components:

- Level 1 Cache—32 KB Instruction, 32 KB Data cache per core
- Level 2 Cache—Unified instruction and data (256 KByte)
- On-Chip Memory:
 - Boot ROM, including HAB (96 KB)
 - Internal multimedia / shared, fast access RAM (OCRAM, 256 KB)
- External memory interfaces:
 - 16-bit, and 32-bit DDR3-800, and LPDDR2-800 channels
 - 16/32-bit NOR Flash.
 - 16/32-bit PSRAM, Cellular RAM (32 bits or less)

Each i.MX 6SoloLite processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

- Displays—Total three interfaces are available.
 - LCD, 24bit display port, up to 225 Mpixels/sec (for example, WUXGA at 60 Hz)

- EPDC, color, and monochrome E-INK, up to 1650x2332 resolution and 5-bit grayscale
- SPDC, color, and monochrome SiPix panels
- Camera sensors:
 - Parallel Camera port (up to 16 bit)
- Expansion cards:
 - Four MMC/SD/SDIO card ports all supporting:
 - 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
 - 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- USB:
 - Two High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
 - One USB 2.0 (480 Mbps) hosts:
 - One HS hosts with integrated HS-IC USB (High Speed Inter-Chip USB) Phy
- Miscellaneous IPs and interfaces:
 - Three I²S/SSI/AC97 supported
 - Five UARTs, up to 4.0 Mbps each:
 - Providing RS232 interface
 - Supporting 9-bit RS485 multidrop mode
 - One of the five UARTs (UART1) supports 8-wire while others four supports 4-wire. This is due to the SoC IOMUX limitation, since all UART IPs are identical.
 - Four eCSPI (Enhanced CSPI)
 - Three I²C, supporting 400 kbps
 - Ethernet Controller, 10/100 Mbps
 - Four Pulse Width Modulators (PWM)
 - System JTAG Controller (SJC)
 - GPIO with interrupt capabilities
 - 8x8 Key Pad Port (KPP)
 - Sony Philips Digital Interface (SPDIF), Rx and Tx
 - Two Watchdog timers (WDOG)
 - Audio MUX (AUDMUX)

The i.MX 6SoloLite processor integrates advanced power management unit and controllers:

- Provide PMU, including LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use Software State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6SoloLite processor uses dedicated HW accelerators to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6SoloLite processor incorporates the following hardware accelerators:

- GPU2Dv2—2D Graphics Processing Unit (BitBlt)
- GPUVG—OpenVG 1.1 Graphics Processing Unit
- PXP—PiXel Processing Pipeline. Off loading key pixel processing operations are required to support the EPD display applications.

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

NOTE

The actual feature set depends on the part numbers as described in [Table 1, "Orderable Part Numbers," on page 3](#). Functions, such as 2D hardware graphics acceleration, E-Ink or SiPix may not be enabled for specific part numbers.

2 Architectural Overview

The following subsections provide an architectural overview of the i.MX 6SoloLite processor system.

2.1 Block Diagram

Figure 2 shows the functional modules in the i.MX 6SoloLite processor system.

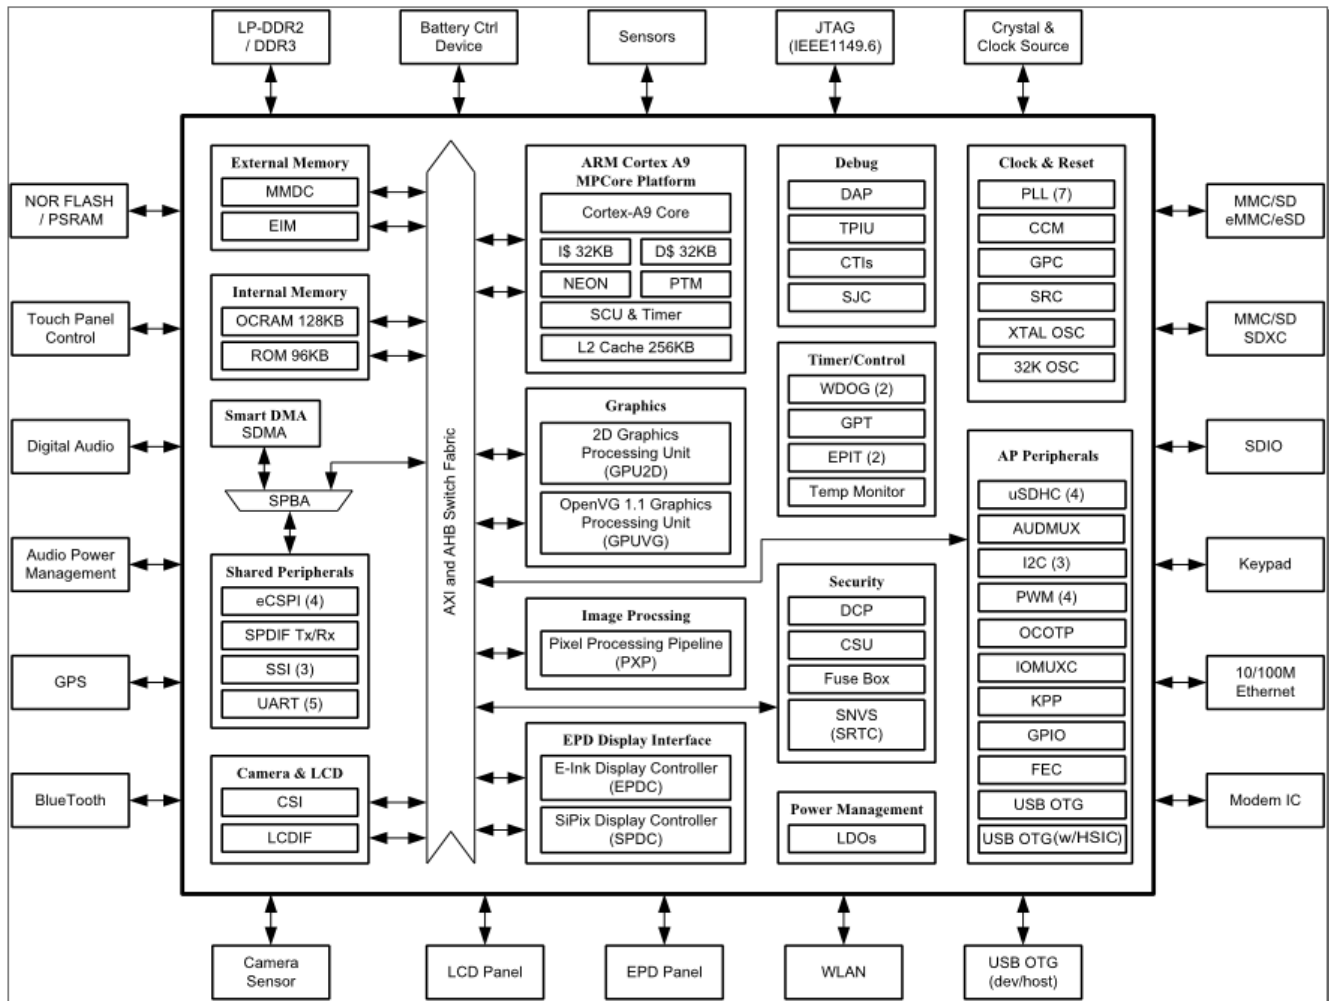

Figure 2. i.MX 6SoloLite System Block Diagram

NOTE

The numbers in brackets indicate number of module instances. For example, PWM (4) indicates four separate PWM peripherals.

3 Modules List

The i.MX 6SoloLite processor contains a variety of digital and analog modules. [Table 2](#) describes these modules in alphabetical order.

Table 2. i.MX 6SoloLite Modules List

Block Mnemonic	Block Name	Subsystem	Brief Description
128x8 Fuse Box	Electrical Fuse Array	Security	Electrical Fuse Array. Enables to setup Boot Modes, Security Levels, Security Keys, and many other system parameters. The i.MX 6SoloLite processor consists of 2-128x8-bit fuse box accessible through OCOTP_CTRL interface.
ARM	ARM Platform	ARM	The ARM Cortex-A9 platform consists of a Cortex-A9 core version r2p10 and associated sub-blocks, including Level 2 Cache Controller, SCU (Snoop Control Unit), GIC (General Interrupt Controller), private timers, Watchdog, and CoreSight debug modules.
AUDMUX	Digital Audio Mux	Multimedia Peripherals	The AUDMUX is a programmable interconnect for voice, audio, and synchronous data routing between host serial interfaces (for example, SSI1, SSI2, and SSI3) and peripheral serial interfaces (audio and voice codecs). The AUDMUX has seven ports with identical functionality and programming models. A desired connectivity is achieved by configuring two or more AUDMUX ports.
CCM GPC SRC	Clock Control Module, Global Power Controller, System Reset Controller	Clocks, Resets, and Power Control	These modules are responsible for clock and reset distribution in the system, and also for the system power management.
CSU	Central Security Unit	Security	The Central Security Unit (CSU) is responsible for setting comprehensive security policy within the i.MX 6SoloLite platform. The Security Control Registers (SCR) of the CSU are set during boot time by the HAB and are locked to prevent further writing.
CTI-1 CTI-2 CTI-3 CTI-4 CTI-5	Cross Trigger Interfaces	Debug / Trace	Cross Trigger Interfaces allows cross-triggering based on inputs from masters attached to CTIs. The CTI module is internal to the Cortex-A9 Core Platform.
CTM	Cross Trigger Matrix	Debug / Trace	Cross Trigger Matrix IP is used to route triggering events between CTIs. The CTM module is internal to the Cortex-A9 Core Platform.
DAP	Debug Access Port	System Control Peripherals	The DAP provides real-time access for the debugger without halting the core to: <ul style="list-style-type: none"> • System memory and peripheral registers • All debug configuration registers The DAP also provides debugger access to JTAG scan chains. The DAP module is internal to the Cortex-A9 Core Platform.
DCP	Data co-processor	Security	This module provides support for general encryption and hashing functions typically used for security functions. Because its basic job is moving data from memory to memory, it also incorporates a memory-copy (memcpy) function for both debugging and as a more efficient method of copying data between memory blocks than the DMA-based approach.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
eCSPI-1 eCSPI-2 eCSPI-3 eCSPI-4	Configurable SPI	Connectivity Peripherals	Full-duplex enhanced Synchronous Serial Interface. It is configurable to support Master/Slave modes, four chip selects to support multiple peripherals.
EIM	NOR-Flash /PSRAM interface	Connectivity Peripherals	The EIM NOR-FLASH / PSRAM provides: <ul style="list-style-type: none"> • Support 16-bit (in muxed IO mode only) PSRAM memories (sync and async operating modes), at slow frequency • Support 16-bit (in muxed IO mode only) NOR-Flash memories, at slow frequency • Multiple chip selects
EPDC	Electrophoretic Display Controller	Peripherals	The EPDC is a feature-rich, low power, and high-performance direct-drive, active matrix EPD controller. It is specifically designed to drive E-INK™ EPD panels, supporting a wide variety of TFT backplanes.
EPIT-1 EPIT-2	Enhanced Periodic Interrupt Timer	Timer Peripherals	Each EPIT is a 32-bit “set and forget” timer that starts counting after the EPIT is enabled by software. It is capable of providing precise interrupts at regular intervals with minimal processor intervention. It has a 12-bit prescaler for division of input clock frequency to get the required time setting for the interrupts to occur, and counter value can be programmed on the fly.
FEC	Fast Ethernet Controller	Connectivity Peripherals	The Ethernet Media Access Controller (MAC) is designed to support 10 and 100 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media.
GPIO-1 GPIO-2 GPIO-3 GPIO-4 GPIO-5	General Purpose I/O Modules	System Control Peripherals	Used for general purpose input/output to external ICs. Each GPIO module supports 32 bits of I/O.
GPT	General Purpose Timer	Timer Peripherals	Each GPT is a 32-bit “free-running” or “set and forget” mode timer with programmable prescaler and compare and capture register. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set and forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock.
GPU2Dv2	Graphics Processing Unit-2D, ver 2	Multimedia Peripherals	The GPU2Dv2 provides hardware acceleration for 2D graphics algorithms, such as Bit BLT, stretch BLT, and many other 2D functions.
GPUVGv2	Vector Graphics Processing Unit ver2	Multimedia Peripherals	OpenVG graphics accelerator provides OpenVG 1.1 support as well as other accelerations, including Real-time hardware curve tessellation of lines, quadratic and cubic Bezier curves, 16x Line Anti-aliasing, and various Vector Drawing functions.
I ² C-1 I ² C-2 I ² C-3	I ² C Interface	Connectivity Peripherals	I ² C provide serial interface for external devices. Data rates of up to 400 kbps are supported.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
IOMUXC	IOMUX Control	System Control Peripherals	This module enables flexible IO multiplexing. Each IO pad has default and several alternate functions. The alternate functions are software configurable.
KPP	Key Pad Port	Connectivity Peripherals	KPP Supports 8 x 8 external key pad matrix. KPP features are: <ul style="list-style-type: none"> • Open drain design • Glitch suppression circuit design • Multiple keys detection • Standby key press detection
LCDIF	LCD Interface	Multimedia Peripherals	The LCDIF provides display data for external LCD panels from simple text-only displays to WVGA, 16/18/24 bpp color TFT panels. The LCDIF supports all of these different interfaces by providing fully programmable functionality and sharing register space, FIFOs, and ALU resources at the same time. The LCDIF supports RGB (DOTCLK) modes as well as system mode including both VSYNC and WSYNC modes.
MMDC	Multi-Mode DDR Controller	Connectivity Peripherals	DDR Controller has the following features: <ul style="list-style-type: none"> • Support 16/32-bit DDR3-800 or LPDDR2-800 • Supports up to 2 GByte DDR memory space
OCOTP_CTRL	OTP Controller	Security	The On-Chip OTP controller (OCOTP_CTRL) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically-programmable poly fuses (eFUSES). The OCOTP_CTRL also provides a set of volatile software-accessible signals that can be used for software control of hardware elements, not requiring non-volatility. The OCOTP_CTRL provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals, requiring permanent non-volatility.
OCRAM	On-Chip Memory controller	Data Path	The On-Chip Memory controller (OCRAM) module is designed as an interface between system's AXI bus and internal (on-chip) SRAM memory module. In i.MX 6SoloLite processor, the OCRAM is used for controlling the 128 KB multimedia RAM through a 64-bit AXI bus.
OCRAM_L2	On-Chip Memory Controller for L2 Cache	Data Path	The On-Chip Memory controller for L2 cache (OCRAM_L2) module is designed as an interface between system's AXI bus and internal (on-chip) L2 cache memory module during boot mode.
OSC 32 kHz	OSC 32 kHz	Clocking	Generates 32.768 kHz clock from external crystal.
PMU	Power-Management functions	Data Path	Integrated power management unit. Used to provide power to various SoC domains.
PWM-1 PWM-2 PWM-3 PWM-4	Pulse Width Modulation	Connectivity Peripherals	The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4x16 data FIFO to generate sound.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
PXP	PiXel Processing Pipeline	Display Peripherals	A high-performance pixel processor capable of 1 pixel/clock performance for combined operations, such as color-space conversion, alpha blending, gamma-mapping, and rotation. The PXP is enhanced with features specifically for gray scale applications. In addition, the PXP supports traditional pixel/frame processing paths for still-image and video processing applications, allowing it to interface with the integrated EPD. either of the integrated EPD controllers.
RAM 128 KB	Internal RAM	Internal Memory	Internal RAM, which is accessed through OCRAM memory controller.
RNGB	Random Number Generator	Security	Random number generating module.
ROM 96KB	Boot ROM	Internal Memory	Supports secure and regular Boot Modes. Includes read protection on 4K region for content protection.
ROMCP	ROM Controller with Patch	Data Path	ROM Controller with ROM Patch support
SDMA	Smart Direct Memory Access	System Control Peripherals	<p>The SDMA is multi-channel flexible DMA engine. It helps in maximizing system performance by off-loading the various cores in dynamic data routing. It has the following features:</p> <ul style="list-style-type: none"> • Powered by a 16-bit Instruction-Set micro-RISC engine • Multi-channel DMA supporting up to 32 time-division multiplexed DMA channels • 48 events with total flexibility to trigger any combination of channels • Memory accesses including linear, FIFO, and 2D addressing • Shared peripherals between ARM and SDMA • Very fast Context-Softwareitching with 2-level priority based preemptive multi-tasking • DMA units with auto-flush and prefetch capability • Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address) • DMA ports can handle unit-directional and bi-directional flows (copy mode) • Up to 8-word buffer for configurable burst transfers • Support of byte-swapping and CRC calculations • Library of Scripts and API is available
SJC	System JTAG Controller	System Control Peripherals	<p>The SJC provides JTAG interface, which complies with JTAG TAP standards, to internal logic. The i.MX 6SoloLite processor uses JTAG port for production, testing, and system debugging. In addition, the SJC provides BSR (Boundary Scan Register) standard support, which complies with IEEE1149.1 and IEEE1149.6 standards.</p> <p>The JTAG port must be accessible during platform initial laboratory bring-up, for manufacturing tests and troubleshooting, as well as for software debugging by authorized entities. The i.MX 6SoloLite SJC incorporates three security modes for protecting against unauthorized accesses. Modes are selected through eFUSE configuration.</p>
SNVS	Secure Non-Volatile Storage	Security	Secure Non-Volatile Storage, including Secure Real Time Clock, Security State Machine, Master Key Control, and Violation/Tamper Detection and reporting.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
SPDC	Electrophoretic Display Controller	Peripherals	The SPDC is a feature-rich, low power, and high-performance direct-drive, active matrix EPD controller. It is specifically designed to drive SiPix™ EPD panels, supporting a wide variety of TFT backplanes.
SPDIF	Sony Phillips Digital Interface	Multimedia Peripherals	A standard audio file transfer format, developed jointly by the Sony and Phillips corporations. Has Transmitter and Receiver functionality.
SSI-1 SSI-2 SSI-3	I2S/SSI/AC97 Interface	Connectivity Peripherals	The SSI is a full-duplex synchronous interface, which is used on the AP to provide connectivity with off-chip audio peripherals. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock / frame sync options. The SSI has two pairs of 8x24 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream that reduces CPU overhead in use cases where two time slots are being used simultaneously.
TEMPMON	Temperature Monitor	System Control Peripherals	The temperature monitor/sensor IP, for detecting high temperature conditions. The Temperature sensor IP for detecting die temperature. The temperature read out does not reflect case or ambient temperature, but the proximity of the temperature sensor location on the die. Temperature distribution may not be uniformly distributed, therefore the read out value may not be the reflection of the temperature value of the entire die.
TZASC	Trust-Zone Address Space Controller	Security	The TZASC (TZC-380 by ARM) provides security address region control functions required for intended application. It is used on the path to the DRAM controller.
UART-1 UART-2 UART-3 UART-4 UART-5	UART Interface	Connectivity Peripherals	Each of the UARTv2 modules support the following serial data transmit/receive protocols and configurations: <ul style="list-style-type: none"> • 7- or 8-bit data words, 1 or 2 stop bits, programmable parity (even, odd or none) • Programmable baud rates up to 4 MHz. This is a higher max baud rate relative to the 1.875 MHz, which is stated by the TIA/EIA-232-F standard and the i.MX31 UART modules. • 32-byte FIFO on Tx and 32 half-word FIFO on Rx supporting auto-baud • IrDA 1.0 support (up to SIR speed of 115200 bps) • Option to operate as 8-pins full UART, DCE, or DTE
USBOH2A	2x USB 2.0 High Speed OTG and 1x HS Hosts	Connectivity Peripherals	USBO2H contains: <ul style="list-style-type: none"> • One Two high-speed OTG module with integrated HS USB PHY • One identical high-speed Host modules connected to HSIC USB ports.

Table 2. i.MX 6SoloLite Modules List (continued)

Block Mnemonic	Block Name	Subsystem	Brief Description
uSDHC-1 uSDHC-2 uSDHC-2 uSDHC-4	SD/MMC and SDXC Enhanced Multi-Media Card / Secure Digital Host Controller	Connectivity Peripherals	<p>i.MX 6SoloLite specific SoC characteristics: All four MMC/SD/SDIO controller IPs are identical and are based on the uSDHC IP. They are:</p> <ul style="list-style-type: none"> Fully compliant with MMC command/response sets and Physical Layer as defined in the Multimedia Card System Specification, v4.2/4.3/4.4 including high-capacity (size > 2 GB) cards HC MMC. HW reset as specified for eMMC cards is supported at ports #3 and #4 only. Fully compliant with SD command/response sets and Physical Layer as defined in the SD Memory Card Specifications, v3.0 including high-capacity SDHC cards up to 32 GB. Fully compliant with SDIO command/response sets and interrupt/read-wait mode as defined in the SDIO Card Specification, Part E1, v1.10 Fully compliant with SD Card Specification, Part A2, SD Host Controller Standard Specification, v2.00 <p>All four ports support:</p> <ul style="list-style-type: none"> 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR104 mode (104 MB/s max) 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max) <p>However, the SoC level integration and I/O muxing logic restrict the functionality to the following:</p> <ul style="list-style-type: none"> Instances #1 and #2 are primarily intended to serve as external slots or interfaces to on-board SDIO devices. These ports are equipped with “Card detection” and “Write Protection” pads and do not support HW reset All ports can work with 1.8 V and 3.3 V cards. There are two completely independent I/O power domains for Ports #1 and #2 in four bit configuration (SD interface). Port #3 is placed in his own independent power domain and port #4 shares power domain with some other interfaces.
WDOG-1	Watchdog	Timer Peripherals	The Watchdog Timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the ARM core, and a second point evokes an external event on the WDOG line.
WDOG-2 (TZ)	Watchdog (TrustZone)	Timer Peripherals	The TrustZone Watchdog (TZ WDOG) timer module protects against TrustZone starvation by providing a method of escaping normal mode and forcing a switch to the TZ mode. TZ starvation is a situation where the normal OS prevents switching to the TZ mode. Such situation is undesirable as it can compromise the system’s security. Once the TZ WDOG module is activated, it must be serviced by TZ software on a periodic basis. If servicing does not take place, the timer times out. Upon a time-out, the TZ WDOG asserts a TZ mapped interrupt that forces switching to the TZ mode. If it is still not served, the TZ WDOG asserts a security violation signal to the CSU. The TZ WDOG module cannot be programmed or deactivated by a normal mode Software.
XTALOSC	Crystal Oscillator I/F	Clocking	The XTALOSC module enables connectivity to external crystal oscillator device. In a typical application use-case, it is used for 24 MHz oscillator.

3.1 Special Signal Considerations

Table 3 lists special signal considerations for the i.MX 6SoloLite processor. The signal names are listed in alphabetical order.

The package contact assignments can be found in Section 6, “Package Information and Contact Assignments.” Signal descriptions are provided in the i.MX 6SoloLite reference manual.

Table 3. Special Signal Considerations

Signal Name	Remarks
CLK1_P/CLK1_N	<p>One general purpose differential high speed clock Input/output is provided. It could be used to:</p> <ul style="list-style-type: none"> To feed external reference clock to the PLLs and further to the modules inside SoC, for example as alternate reference clock for Audio interfaces, etc. To output internal SoC clock to be used outside the SoC as either reference clock or as a functional clock for peripherals. <p>See the i.MX 6SoloLite reference manual for details on the respective clock trees. The clock inputs/outputs are LVDS differential pairs compatible with TIA/EIA-644 standard, the maximal clock out frequency range supported is 528 MHz. Alternatively one may use single ended signal to drive CLK1_P input. In this case corresponding CLK1_N input should be tied to the constant voltage level equal 1/2 of the input signal swing. Termination should be provided in case of high frequency signals. See LVDS pad electrical specification for further details. After initialization, the CLK1 input/output could be disabled (if not used). If unused, the CLK1_N/P pair may be left floating.</p>
DRAM_VREF	<p>When using DRAM_VREF with DDR I/O, the nominal reference voltage must be half of the NVCC_DRAM supply. The user must tie DRAM_VREF to a precision external resistor divider. Use a 1 kΩ 0.5% resistor to GND and a 1 kΩ 0.5% resistor to NVCC_DRAM. Shunt each resistor with a closely-mounted 0.1 μF capacitor. To reduce supply current, a pair of 1.5 kΩ 0.1% resistors can be used. Using resistors with recommended tolerances ensures the \pm 2% DRAM_VREF tolerance (per the DDR3 specification) is maintained when four DDR3 ICs plus the i.MX 6SoloLite are drawing current on the resistor divider. It is recommended to use regulated power supply for “big” memory configurations (more that eight devices).</p>
GPANAIO	<p>This signal is reserved for Freescale manufacturing use only. User must leave this connection floating.</p>
JTAG_####	<p>The JTAG interface is summarized in Table 4. Use of external resistors is unnecessary. However, if external resistors are used, the user must ensure that the on-chip pull-up/down configuration is followed. For example, do not use an external pull down on an input that has on-chip pull-up.</p> <p>JTAG_TDO is configured with a keeper circuit such that the floating condition is eliminated if an external pull resistor is not present. An external pull resistor on JTAG_TDO is detrimental and should be avoided.</p> <p>JTAG_MOD is referenced as SJC_MOD in the i.MX 6SoloLite reference manual. Both names refer to the same signal. JTAG_MOD must be externally connected to GND for normal operation. Termination to GND through an external pull-down resistor (such as 1 kΩ) is allowed. JTAG_MOD set to hi configures the JTAG interface to mode compliant with IEEE1149.1 standard. JTAG_MOD set to low configures the JTAG interface for common Software debug adding all the system TAPs to the chain.</p>
NC	<p>These signals are No Connect (NC) and should be floated by the user.</p>

Table 3. Special Signal Considerations (continued)

Signal Name	Remarks
ONOFF	In normal mode may be connected to ON/OFF button (De-bouncing provided at this input). Internally this pad is pulled up. Short connection to GND in OFF mode causes internal power management state machine to change state to ON. In ON mode short connection to GND generates interrupt (intended to Software controllable power down). Long above ~5s connection to GND causes “forced” OFF.
POR_B	This cold reset negative logic input resets all modules and logic in the IC. May be used in addition to internally generated power on reset signal (logical AND, both internal and external signals are considered active low)
RTC_XTALI/RTC_XTALO	If the user wishes to configure RTC_XTALI and RTC_XTALO as an RTC oscillator, a 32.768 kHz crystal (≤ 100 k Ω ESR, 10 pF load) should be connected between RTC_XTALI and RTC_XTALO. Keep in mind the capacitors implemented on either side of the crystal are about twice the crystal load capacitor. To hit the exact oscillation frequency, the board capacitors need to be reduced to account for board and chip parasitics. The integrated oscillation amplifier is self biasing, but relatively weak. Care must be taken to limit parasitic leakage from RTC_XTALI and RTC_XTALO to either power or ground (>100 M Ω). This will debias the amplifier and cause a reduction of startup margin. Typically RTC_XTALI and RTC_XTALO should bias to approximately 0.5 V. If it is desired to feed an external low frequency clock into RTC_XTALI the RTC_XTALO pin should be left floating or driven with a complimentary signal. The logic level of this forcing clock should not exceed VDD_SNVS_CAP level and the frequency should be <100 kHz under typical conditions. In case when high accuracy real time clock are not required system may use internal low frequency ring oscillator. It is recommended to connect RTC_XTALI to GND and keep RTC_XTALO floating.
TEST_MODE	TEST_MODE is for Freescale factory use. This signal is internally connected to an on-chip pull-down device. The user must either float this signal or tie it to GND.
XTALI/XTALO	A 24.0 MHz crystal should be connected between XTALI and XTALO. level and the frequency should be <32 MHz under typical conditions. The crystal must be rated for a maximum drive level of 250 μ W. An ESR (equivalent series resistance) of typically 80 Ω is recommended. Freescale BSP (board support package) software requires 24 MHz on XTALI/XTALO. The crystal can be eliminated if an external 24 MHz oscillator is available in the system. In this case, XTALI must be directly driven by the external oscillator and XTALO is floated. The XTALI signal level must swing from $\sim 0.8 \times$ NVCC_PLL_OUT to ~ 0.2 V. This clock is used as a reference for USB, PCIe, and SATA, so there are strict frequency tolerance and jitter requirements. See the XTALOSC chapter and relevant interface specifications chapters of the i.MX 6SoloLite reference manual, for details.
ZQPAD	DRAM calibration resistor 240 Ω 1% used as reference during DRAM output buffer driver calibration should be connected between this pad and GND.

¹ Applying the maximum voltage results in maximum power consumption and heat generation. Freescale recommends a voltage set point = (V_{min} + the supply tolerance). This results in an optimized power/speed ratio.

² VDD_ARM_IN and VDDSOC_IN must be at least 125 mV higher than the LDO Output Set Point for correct voltage regulation.

³ VDD_SOC_CAP and VDD_PU_CAP must be equal.

⁴ VDDSOC and VDDPU output voltage must be set to this rule: VDDARM-VDDSOC/PU<50mV

⁵ While setting VDD_SNVIS_IN voltage with respect to Charging Currents and RTC, refer to Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG).

⁶ All digital I/O supplies (NVCC_xxxx) must be powered under normal conditions whether the associated I/O pins are in use or not, and associated I/O pins need to have a pull-up or pull-down resistor applied to limit any floating gate current.

4.1.4 External Clock Sources

Each i.MX 6SoloLite processor has two external input system clocks: a low frequency (RTC_XTAL) and a high frequency (XTAL).

The RTC_XTAL is used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and Watchdog counters. The clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier. Additionally, there is an internal ring oscillator, which can substitute the RTC_XTAL, in case accuracy is not important.

The system clock input XTAL is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier.

Table 10 shows the interface frequency requirements.

Table 10. External Input Clock Frequency

Parameter Description	Symbol	Min	Typ	Max	Unit
RTC_XTAL Oscillator ^{1,2}	f _{ckil}	—	32.768 ³ /32.0	—	kHz
XTAL Oscillator ^{4,2}	f _{xtal}		24		MHz

¹ External oscillator or a crystal with internal oscillator amplifier.

² The required frequency stability of this clock source is application dependent. For recommendations, see Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG).

³ Recommended nominal frequency 32.768 kHz.

⁴ External oscillator or a fundamental frequency crystal with internal oscillator amplifier.

The typical values shown in [Table 10](#) are required for use with Freescale BSPs to ensure precise time keeping and USB operation. For RTC_XTAL operation, two clock sources are available:

- On-chip 40 kHz ring oscillator: This clock source has the following characteristics:
 - Approximately 25 μ A more I_{dd} than crystal oscillator
 - Approximately \pm 50% tolerance
 - No external component required
 - Starts up quicker than 32 kHz crystal oscillator
- External crystal oscillator with on-chip support circuit
 - At power up, ring oscillator is utilized. After crystal oscillator is stable, the clock circuit switches over to the crystal oscillator automatically.
 - Higher accuracy than ring oscillator
 - If no external crystal is present, then the ring oscillator is utilized

The decision of choosing a clock source should be taken based on real-time clock use and precision timeout.

4.1.5 Maximal Supply Currents

The Power Virus numbers shown in [Table 11](#) represent a use case designed specifically to show the maximum current consumption possible. All cores are running at the defined maximum frequency and are limited to L1 cache accesses only to ensure no pipeline stalls. Although a valid condition, it would have a very limited practical use case, if at all, and be limited to an extremely low duty cycle unless the intention was to specifically show the worst case power consumption.

The MMPF0100xxxx, Freescale's power management IC targeted for the i.MX 6x family, supports the Power Virus mode operating at 1% duty cycle. Higher duty cycles are allowed, but a robust thermal design is required for the increased system power dissipation.

See the i.MX 6SoloLite Power Consumption Measurement Application Note for more details on typical power consumption under various use case definitions.

Table 11. Maximal Supply Currents

Power Line	Conditions	Max Current	Unit
VDD_ARM_IN	1 GHz ARM clock based on Power Virus operation	1100	mA
VDD_SOC_IN	1 GHz ARM clock	650	mA
VDD_PU_IN	1 GHz ARM clock	150	mA
VDD_HIGH_IN	—	30 ¹	mA
VDD_SNVS_IN	—	250 ²	μ A

NVCC33_IO	N=156	Use maximal IO Equation ⁵	
NVCC18_IO	N=156	Use maximal IO Equation ⁵	
MISC			
DRAM_VREF	—	1	mA

¹ The actual maximum current drawn from VDDHIGH_IN will be as shown plus any additional current drawn from the VDDHIGH_CAP outputs, depending upon actual application configuration (for example, NVCC_DRAM_2P5 supplies).

² The maximum VDD_SNV5_IN current may be higher depending on specific operating configurations, such as BOOT_MODE[1:0] not equal to 00, or use of the Tamper feature. During initial power on, VDD_SNV5_IN can draw up to 1 mA, if available. VDD_SNV5_CAP charge time will increase if less than 1 mA is available.

³ This is the maximum current per active USB physical interface.

⁴ The DRAM power consumption is dependent on several factors, such as external signal termination. DRAM power calculators are typically available from the memory vendors. They take in account factors, such as signal termination. See the i.MX 6SoloLite Power Consumption Measurement Application Note or examples of DRAM power consumption during specific use case scenarios.

⁵ General equation for estimated, maximal power consumption of an IO power supply:
 $I_{max} = N \times C \times V \times (0.5 \times F)$
 Where:
 N—Number of IO pins supplied by the power line
 C—Equivalent external capacitive load
 V—IO voltage
 (0.5 xF)—Data change rate. Up to 0.5 of the clock rate (F)
 In this equation, I_{max} is in Amps, C in Farads, V in Volts, and F in Hertz.

4.1.6 Low Power Mode Supply Currents

4.1.7 USB PHY Current Consumption

4.1.7.1 Power Down Mode

In power down mode, everything is powered down, including the VBUS valid detectors, typ condition. [Table 13](#) shows the USB interface current consumption in power down mode.

Table 13. USB PHY Current Consumption in Power Down Mode

	VDDUSB_CAP (3.0 V)	VDDHIGH_CAP (2.5 V)	NVCC_PLL_OUT (1.1 V)
Current	5.1 μ A	1.7 μ A	<0.5 μ A

NOTE

The currents on the VDDHIGH_CAP and VDDUSB_CAP were identified to be the voltage divider circuits in the USB-specific level shifters.

4.2 Power Supplies Requirements and Restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor (worst-case scenario)

4.2.1 Power-Up Sequence

For power-up sequence, the restrictions are as follows:

- VDD_SNVS_IN supply must be turned ON before any other power supply. It may be connected (shorted) with VDD_HIGH_IN supply.
- If a coin cell is used to power VDD_SNVS_IN, then ensure that it is connected before any other supply is switched on.
- If VDD_ARM_IN and VDD_SOC_IN are connected to different external supply sources, then VDD_ARM_IN supply must be turned ON together with VDD_SOC_IN supply or not delayed more than 1 ms.

NOTE

The POR_B input (if used) must be immediately asserted at power-up and remain asserted until the last power rail reaches its working voltage. In the absence of an external reset feeding the POR_B input, the internal POR module takes control. See the i.MX 6SoloLite reference manual for further details and to ensure that all necessary requirements are being met.

NOTE

Need to ensure that there is no back voltage (leakage) from any supply on the board towards the 3.3 V supply (for example, from the external components that use both the 1.8 V and 3.3 V supplies).

4.2.2 Power-Down Sequence

Table 14 shows the power down sequence orders. The two cases shown are, using the i.MX6 SoloLite internal supplies (non-bypass) and bypassing the internal LDO supplies.

Table 14. Power-Down Sequencing Order

Power Rail Name	Using all internal LDOs (non-bypass mode)	Internal LDOs Bypassed
VDD_SNV5_IN	7	9
VDD_HIGH_IN / NVCC33_IO	6	8
VDD_HIGH_CAP	6	7
NVCC18_IO	5	6
NVCC_PLL	6	5
NVCC_DRAM	4	4
VDD_ARM_IN	3	3
VDD_PU_IN	2	2
VDD_SOC_IN	1	1
USB_VBUS	N/A	N/A

NOTE

- VDD_ARM_IN, VDD_PU_IN, and VDD_SOC_IN can startup at the same. However, VDD_ARM_IN and VDD_PU_IN must be at their target values within 0.5 ms of VDD_SOC_IN.
- There are no special timing requirements for USB_VBUS.

4.2.3 Power Supplies Usage

- All I/O pins should not be externally driven while the I/O power supply for the pin (NVCC_XXX) is OFF. This can cause internal latch-up and malfunctions due to reverse current flows. For information about I/O power supply of each pin, see “Power Group” column of Table 80, “13 x 13 mm Functional Contact Assignments,” on page 101.

4.3 Integrated LDO Voltage Regulator Parameters

Various internal supplies can be powered ON from internal LDO voltage regulators. All the supply pins named *_CAP must be connected to external capacitors. The onboard LDOs are intended for internal use only and should not be used to power any external circuitry. See the i.MX 6SoloLite reference manual for details on the power tree scheme recommended operation.

NOTE

The *_CAP signals should not be powered externally. These signals are intended for internal LDO or LDO bypass operation only.

4.3.1 Digital Regulators (LDO_ARM, LDO_PU, LDO_SOC)

There are three digital LDO regulators (“Digital”, because of the logic loads that they drive, not because of their construction). The advantages of the regulators are to reduce the input supply variation because of their input supply ripple rejection and their on die trimming. This translates into more voltage for the die producing higher operating frequencies. These regulators have three basic modes.

- Bypass. The regulation FET is switched fully on passing the external voltage, DCDC_LOW, to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and FET.
- Power Gate. The regulation FET is switched fully off limiting the current draw from the supply. The analog part of the regulator is powered down here limiting the power consumption.
- Analog regulation mode. The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25 mV steps.

For additional information, see the i.MX 6SoloLite reference manual.

4.3.2 Analog Regulators

4.3.2.1 LDO_1P1

The LDO_1P1 regulator implements a programmable linear-regulator function from VDDHIGH_IN (see [Table 9](#) for min and max input requirements). Typical Programming Operating Range is 1.0 V to 1.2 V with the nominal default setting as 1.1 V. Since we are not testing the accuracy or the % regulation, and only testing with the LDO set to either 1.0V or 1.2V, this is the only range that is guaranteed. The regulator has been designed to be stable with a minimum external low ESR decoupling capacitor of 1 μ F (2.2 μ F should be considered the recommended minimum value), though the actual capacitance required should be determined by the application. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature.

For additional information, see the i.MX 6SoloLite reference manual.

4.3.2.2 LDO_2P5

The LDO_2P5 module implements a programmable linear-regulator function from VDDHIGH_IN (see Table 9 for min and max input requirements). Typical Programming Operating Range is 2.25 V to 2.75 V with the nominal default setting as 2.5 V. Since we are not testing the accuracy or the % regulation, and only testing with the LDO set to either 2.25V or 2.75V, this is the only range that is guaranteed. The regulator has been designed to be stable with a minimum external low ESR decoupling capacitor of 1 μ F (2.2 μ F should be considered the recommended minimum value), though the actual capacitance required should be determined by the application. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature. An alternate self-biased low-precision weak-regulator is included that can be enabled for applications needing to keep the output voltage alive during low-power modes where the main regulator driver and its associated global bandgap reference module are disabled. The output of the weak-regulator is not programmable and is a function of the input supply as well as the load current. Typically, with a 3 V input supply the weak-regulator output is 2.525 V and its output impedance is approximately 40 Ω .

For additional information, see the i.MX 6SoloLite reference manual.

4.3.2.3 LDO_USB

The LDO_USB module implements a programmable linear-regulator function from the USB_OTG_VBUS and USB_H1_VBUS voltages (4.4 V–5.25 V) to produce a nominal 3.0 V output voltage. The regulator has been designed to be stable with a minimum external low ESR decoupling capacitor of 1 μ F (2.2 μ F should be considered the recommended minimum value), though the actual capacitance required should be determined by the application. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. This regulator has a built in power-mux that allows the user to select to run the regulator from either VBUS supply, when both are present. If only one of the VBUS voltages is present, then, the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets. If no VBUS voltage is present, then the VBUSVALID threshold setting will prevent the regulator from being enabled.

For additional information, see the i.MX 6SoloLite reference manual.

4.5 On-Chip Oscillators

4.5.1 OSC24M

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements an oscillator. It also implements a power mux such that the oscillator can be powered from VDD1P1 or VDD_SOC. VDD_1P1 should be the cleaner supply and is the preferable choice, but if the oscillator is needed to run in "stop mode" then it is necessary to run from VDD_SOC, which is 0.9 V in stop mode.

The system crystal oscillator consists of a Pierce-type structure running off the digital supply. A straight forward biased-inverter implementation is used.

4.5.2 OSC32K

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements a low power oscillator. It also implements a power mux such that it can be powered from either a ~3 V backup battery (VDD_SNVS_IN) or VDD_HIGH_IN such as the oscillator consumes power from VDD_HIGH_IN when that supply is available and transitions to the back up battery when VDD_HIGH_IN is lost.

In addition, if the clock monitor determines that the OSC32K is not present, then the source of the 32 K will automatically switch to a crude internal ring oscillator. The frequency range of this block is approximately 10–45 kHz. It highly depends on the process, voltage, and temperature.

The OSC32k runs from VDD_SNVS_CAP, which comes from the VDD_HIGH_IN/VDD_SNVS_IN power mux. The target battery is a ~3 V coin cell. Proper choice of coin cell type is necessary for chosen VDD_HIGH_IN range. Appropriate series resistor (Rs) must be used when connecting the coin cell. Rs depends on the charge current limit that depends on the chosen coin cell. For example, for Panasonic ML621:

- Average Discharge Voltage is 2.5 V
- Maximum Charge Current is 0.6 mA

For a charge voltage of 3.2 V, $R_s = (3.2-2.5)/0.6 \text{ m} = 1.17 \text{ k}$

NOTE

Always refer to the chosen coin cell manufacturer's data sheet for the latest information.

Table 20. OSC32K Main Characteristics

Parameter	Min	Typ	Max	Comments
Fosc		32.768 kHz		This frequency is nominal and determined mainly by the crystal selected. 32.0 K would work as well.
Current consumption		4 μ A		The typical value shown is only for the oscillator, driven by an external crystal. If the internal ring oscillator is used instead of an external crystal, then approximately 25 μ A should be added to this value.
Bias resistor		14 M Ω		This the integrated bias resistor that sets the amplifier into a high gain state. Any leakage through the ESD network, external board leakage, or even a scope probe that is significant relative to this value will debias the amp. The debiasing will result in low gain, and will impact the circuit's ability to start up and maintain oscillations.
Target Crystal Properties				
Cload		10 pF		Usually crystals can be purchased tuned for different Cloads. This Cload value is typically 1/2 of the capacitances realized on the PCB on either side of the quartz. A higher Cload will decrease oscillation margin, but increases current oscillating through the crystal.
ESR		50 k Ω		Equivalent series resistance of the crystal. Choosing a crystal with a higher value will decrease the oscillating margin.

4.6 I/O DC Parameters

This section includes the DC parameters of the following I/O types:

- Dual Voltage General Purpose I/O cell set (DVGPIO)
- Single Voltage General Purpose I/O cell set (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2 and DDR3 modes

NOTE

The term 'OVDD' in this section refers to the associated supply rail of an input or output.

¹ Overshoot and undershoot conditions (transitions above OVDD and below GND) on switching pads must be held below 0.6 V, and the duration of the overshoot/undershoot must not exceed 10% of the system clock cycle. Overshoot/undershoot must be controlled through printed circuit board layout, transmission line impedance matching, signal line termination, or other methods. Non-compliance to this specification may affect device reliability or cause permanent damage to the device.

² DSE is the Drive Strength Field setting in the associated IOMUX control register.

³ To maintain a valid level, the transition edge of the input must sustain a constant slew rate (monotonic) from the current DC level through to the target DC level, Vil or Vih. Monotonic input transition time is from 0.1 ns to 1 s.

⁴ Hysteresis of 250 mV is guaranteed over all operating conditions when hysteresis is enabled.

4.6.2 Single Voltage General Purpose I/O (GPIO) DC Parameters

4.8 Output Buffer Impedance Parameters

This section defines the I/O impedance parameters of the i.MX 6SoloLite processor for the following I/O types:

- Dual Voltage General Purpose I/O cell set (DVGPI0)
- Single Voltage General Purpose I/O cell set (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2, and DDR3 modes

NOTE

GPIO and DDR I/O output driver impedance is measured with “long” transmission line of impedance Ztl attached to I/O pad and incident wave launched into transmission line. Rpu/Rpd and Ztl form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see [Figure 7](#)).

$$R_{pu} = \frac{V_{ovdd} - V_{ref1}}{V_{ref1}} \times Z_{tl}$$

$$R_{pd} = \frac{V_{ref2}}{V_{ovdd} - V_{ref2}} \times Z_{tl}$$

NOTE

XTALI is approximately 32 kHz. XTALI cycle is one period or approximately 30 μs.

NOTE

WDOG_B output signals (for each one of the Watchdog modules) do not have dedicated bins, but are muxed out through the IOMUX. See the IOMUX manual for detailed information.

4.9.3 External Interface Module (EIM)

The following subsections provide information on the EIM.

4.9.3.1 EIM Signal Cross Reference

Table 35 is a guide intended to help the user identify the signals in the EIM chapter of the i.MX 6SoloLite reference manual that are identical to those mentioned in this data sheet.

4.10 External Peripheral Interface Parameters

The following subsections provide information on external peripheral interfaces.

4.10.1 AUDMUX Timing Parameters

The AUDMUX provides a programmable interconnect logic for voice, audio, and data routing between internal serial interfaces (SSIs) and external serial interfaces (audio and voice codecs). The AC timing of AUDMUX external pins is governed by the SSI module. For more information, see the respective SSI electrical specifications found within this document.

4.10.2 CMOS Sensor Interface (CSI) Timing Parameters

4.10.2.0.1 Gated Clock Mode Timing

Figure 28 and Figure 29 shows the gated clock mode timings for CSI, and Table 45 describes the timing parameters (P1–P7) shown in the figures. A frame starts with a rising/falling edge on VSYNC, then HSYNC is asserted and holds for the entire line. The pixel clock is valid as long as HSYNC is asserted.

Figure 28. CSI Gated Clock Mode—Sensor Data at Falling Edge, Latch Data at Rising Edge

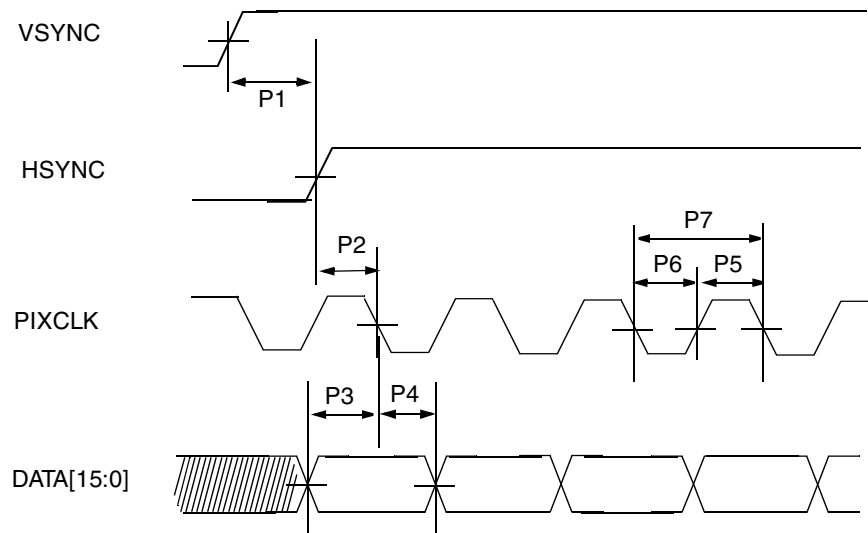

Figure 29. CSI Gated Clock Mode—Sensor Data at Rising Edge, Latch Data at Falling Edge

Table 45. CSI Gated Clock Mode Timing Parameters

ID	Parameter	Symbol	Min.	Max.	Units
P1	CSI VSYNC to HSYNC time	tV2H	67.5	—	ns
P2	CSI HSYNC setup time	tHsu	2	—	ns
P3	CSI DATA setup time	tDsu	2.5	—	ns
P4	CSI DATA hold time	tDh	1.2	—	ns
P5	CSI pixel clock high time	tCLKh	10	—	ns
P6	CSI pixel clock low time	tCLKl	10	—	ns
P7	CSI pixel clock frequency	fCLK	—	66 ± 10%	MHz

4.10.2.0.2 Ungated Clock Mode Timing

Figure 30 shows the ungated clock mode timings of CSI, and Table 46 describes the timing parameters (P1–P6) that are shown in the figure. In ungated mode the VSYNC and PIXCLK signals are used, and the HSYNC signal is ignored.

Figure 30. CSI Ungated Clock Mode—Sensor Data at Falling Edge, Latch Data at Rising Edge

Table 46. CSI Ungated Clock Mode Timing Parameters

ID	Parameter	Symbol	Min.	Max.	Units
P1	CSI VSYNC to pixel clock time	tVSYNC	67.5	—	ns
P2	CSI DATA setup time	tDsu	2.5	—	ns
P3	CSI DATA hold time	tDh	1.2	—	ns
P4	CSI pixel clock high time	tCLKh	10	—	ns
P5	CSI pixel clock low time	tCLKl	10	—	ns
P6	CSI pixel clock frequency	fCLK	—	66 ± 10%	MHz

The CSI enables the chip to connect directly to external CMOS image sensors, which are classified as dumb or smart as follows:

- Dumb sensors only support traditional sensor timing (vertical sync (VSYNC) and horizontal sync(HSYNC)) and output-only Bayer and statistics data.
- Smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The following subsections describe the CSI timing in gated and ungated clock modes.

4.10.3 ECSPI Timing Parameters

This section describes the timing parameters of the ECSPI block. The ECSPI has separate timing parameters for master and slave modes.

4.10.5 FEC AC Timing Parameters

This section describes the electrical information of the Fast Ethernet Controller (FEC) module. The FEC is designed to support both 10 and 100 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The FEC supports the 10/100 Mbps MII (18 pins in total) and the 10 Mbps (only 7-wire interface, which uses 7 of the MII pins), for connection to an external Ethernet transceiver. For the pin list of MII and 7-wire, see the i.MX 6SoloLite Reference Manual.

This section describes the AC timing specifications of the FEC. The MII signals are compatible with transceivers operating at a voltage of 3.3 V.

4.10.5.1 MII Receive Signal Timing

The MII receive signal timing involves the FEC_RX_DATA3,2,1,0, FEC_RX_DV, FEC_RX_ER, and FEC_RX_CLK signals. The receiver functions correctly up to a FEC_RX_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement but the processor clock frequency must exceed twice the FEC_RX_CLK frequency. Table 52 lists the MII receive channel signal timing parameters and Figure 36 shows MII receive signal timings.

Table 52. MII Receive Signal Timing

No.	Characteristics ^{1 2}	Min	Max	Unit
M1	FEC_RX_DATA3,2,1,0, FEC_RX_DV, FEC_RX_ER to FEC_RX_CLK setup	5	—	ns
M2	FEC_RX_CLK to FEC_RX_DATA3,2,1,0, FEC_RX_DV, FEC_RX_ER hold	5	—	ns
M3	FEC_RX_CLK pulse width high	35%	65%	FEC_RX_CLK period
M4	FEC_RX_CLK pulse width low	35%	65%	FEC_RX_CLK period

¹ FEC_RX_DV, FEC_RX_CLK, and FEC_RXD0 have same timing in 10 Mbps 7-wire interface mode.

² Test conditions: 25pF on each output signal.

Figure 36. MII Receive Signal Timing Diagram

4.10.5.2 MII Transmit Signal Timing

The MII transmit signal timing affects the FEC_TX_DATA3,2,1,0, FEC_TX_EN, FEC_TX_ER, and FEC_TX_CLK signals. The transmitter functions correctly up to a FEC_TX_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed twice the FEC_TX_CLK frequency.

Table 53 lists MII transmit channel timing parameters. Figure 37 shows MII transmit signal timing diagram for the values listed in Table 53.

Table 53. MII Transmit Signal Timing

Num	Characteristic ^{1 2}	Min	Max	Unit
M5	FEC_TX_CLK to FEC_TX_DATA3,2,1,0, FEC_TX_EN, FEC_TX_ER invalid	5	—	ns

M7	FEC_TX_CLK pulse width high	35%	65%	FEC_TX_CLK period
M8	FEC_TX_CLK pulse width low	35%	65%	FEC_TX_CLK period

¹ FEC_TX_EN, FEC_TX_CLK, and FEC_TXD0 have the same timing in 10 Mbps 7-wire interface mode.

² Test conditions: 25pF on each output signal.

Figure 37. MII Transmit Signal Timing Diagram

4.10.5.3 MII Async Inputs Signal Timing (FEC_CRIS and FEC_COL)

Table 54 lists MII asynchronous inputs signal timing information. Figure 38 shows MII asynchronous input timings listed in Table 54.

Table 54. MII Async Inputs Signal Timing

Num	Characteristic ¹	Min	Max	Unit
M9 ²	FEC_CRIS to FEC_COL minimum pulse width	1.5	—	FEC_TX_CLK period

¹ Test conditions: 25pF on each output signal.

² FEC_COL has the same timing in 10 Mbit 7-wire interface mode.

Figure 38. MII Async Inputs Timing Diagram

4.10.5.4 MII Serial Management Channel Timing (FEC_MDIO and FEC_MDC)

Table 55 lists MII serial management channel timings. Figure 39 shows MII serial management channel timings listed in Table 55. The MDC frequency should be equal to or less than 2.5 MHz to be compliant with the IEEE 802.3 MII specification. However, the FEC can function correctly with a maximum MDC frequency of 15 MHz.

Table 55. MII Transmit Signal Timing

4.10.5.5 RMII Mode Timing

In RMII mode, FEC_TX_CLK is used as the REF_CLK which is a 50 MHz \pm 50 ppm continuous reference clock. FEC_RX_DV is used as the CRS_DV in RMII, and other signals under RMII mode include FEC_TX_EN, FEC_TXD[1:0], FEC_RXD[1:0] and optional FEC_RX_ER.

The RMII mode timings are shown in Table 56 and Figure 40.

4.10.6 I²C Module Timing Parameters

This section describes the timing parameters of the I²C module. Figure 41 depicts the timing of I²C module, and Table 57 lists the I²C module timing characteristics.

Figure 41. I²C Bus Timing

Table 57. I²C Module Timing Parameters

ID	Parameter	Standard Mode		Fast Mode		Unit
		Min	Max	Min	Max	
IC1	I2CLK cycle time	10	—	2.5	—	μs
IC2	Hold time (repeated) START condition	4.0	—	0.6	—	μs
IC3	Set-up time for STOP condition	4.0	—	0.6	—	μs
IC4	Data hold time	0 ¹	3.45 ²	0 ¹	0.9 ²	μs
IC5	HIGH Period of I2CLK Clock	4.0	—	0.6	—	μs
IC6	LOW Period of the I2CLK Clock	4.7	—	1.3	—	μs
IC7	Set-up time for a repeated START condition	4.7	—	0.6	—	μs
IC8	Data set-up time	250	—	100 ³	—	ns
IC9	Bus free time between a STOP and START condition	4.7	—	1.3	—	μs
IC10	Rise time of both I2DAT and I2CLK signals	—	1000	20 + 0.1C _b ⁴	300	ns
IC11	Fall time of both I2DAT and I2CLK signals	—	300	20 + 0.1C _b ⁴	300	ns
IC12	Capacitive load for each bus line (C _b)	—	400	—	400	pF

¹ A device must internally provide a hold time of at least 300 ns for I2DAT signal in order to bridge the undefined region of the falling edge of I2CLK.

² The maximum hold time has only to be met if the device does not stretch the LOW period (ID no IC5) of the I2CLK signal.

³ A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement of Set-up time (ID No IC7) of 250 ns must be met. This automatically is the case if the device does not stretch the LOW period of the I2CLK signal. If such a device does stretch the LOW period of the I2CLK signal, it must output the next data bit to the I2DAT line $\text{max_rise_time (IC9) + data_setup_time (IC7) = 1000 + 250 = 1250 ns}$ (according to the Standard-mode I2C-bus specification) before the I2CLK line is released.

⁴ C_b = total capacitance of one bus line in pF.

4.10.7 Pulse Width Modulator (PWM) Timing Parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin.

Figure 42 depicts the timing of the PWM, and Table 58 lists the PWM timing parameters.

4.10.9 SPDIF Timing Parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 60 and Figure 47 and Figure 48 show SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SRCK) for SPDIF in Rx mode and the timing of the modulating Tx clock (STCLK) for SPDIF in Tx mode.

4.10.10 SSI Timing Parameters

This section describes the timing parameters of the SSI module. The connectivity of the serial synchronous interfaces are summarized in [Table 61](#).

Table 61. AUDMUX Port Allocation

Port	Signal Nomenclature	Type and Access
AUDMUX port 1	SSI 1	Internal
AUDMUX port 2	SSI 2	Internal
AUDMUX port 3	AUD3	External – AUD3 I/O
AUDMUX port 4	AUD4	External – I2C2 and LCD or ECSP11 I/O through IOMUXC
AUDMUX port 5	AUD5	External – EPDC or SD3 I/O through IOMUXC
AUDMUX port 6	AUD6	External – FEC or KEY_ROW and KEY_COL through IOMUXC
AUDMUX port 7	SSI 3	Internal

NOTE

- The terms WL and BL used in the timing diagrams and tables refer to Word Length (WL) and Bit Length (BL).
- The SSI timing diagrams use generic signal names wherein the names used in the i.MX 6SoloLite reference manual are channel specific signal names. For example, a channel clock referenced in the IOMUXC chapter as AUD3_TXC appears in the timing diagram as TXC.

4.10.10.1 SSI Transmitter Timing with Internal Clock

NOTE

- All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal STCK/SRCK and/or the frame sync STFS/SRFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is being used for data transfer.
- The terms, WL and BL, refer to Word Length (WL) and Bit Length (BL).
- “Tx” and “Rx” refer to the Transmit and Receive sections of the SSI.
- For internal Frame Sync operation using external clock, the FS timing is same as that of Tx Data (for example, during AC97 mode of operation).

4.10.11.2 UART RS-232 Serial Mode Timing

The following sections describe the electrical information of the UART module in the RS-232 mode.

4.10.11.2.1 UART Transmitter

Figure 53 depicts the transmit timing of UART in the RS-232 serial mode, with 8 data bit/1 stop bit format. Table 67 lists the UART RS-232 serial mode transmit timing characteristics.

Figure 53. UART RS-232 Serial Mode Transmit Timing Diagram

Table 67. RS-232 Serial Mode Transmit Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA1	Transmit Bit Time	t_{Tbit}	$1/F_{baud_rate}^1 - T_{ref_clk}^2$	$1/F_{baud_rate} + T_{ref_clk}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

4.10.11.2.2 UART Receiver

Figure 54 depicts the RS-232 serial mode receive timing with 8 data bit/1 stop bit format. Table 68 lists serial mode receive timing characteristics.

Figure 54. UART RS-232 Serial Mode Receive Timing Diagram

Table 68. RS-232 Serial Mode Receive Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA2	Receive Bit Time ¹	t_{Rbit}	$1/F_{baud_rate}^2 - 1/(16 * F_{baud_rate})$	$1/F_{baud_rate} + 1/(16 * F_{baud_rate})$	—

¹ The UART receiver can tolerate $1/(16 * F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 * F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

4.10.11.2.3 UART IrDA Mode Timing

The following subsections give the UART transmit and receive timings in IrDA mode.

UART IrDA Mode Transmitter

UA3	Transmit Bit Time in IrDA mode	t_{TIRbit}	$1/F_{baud_rate}^1 - T_{ref_clk}^2$	$1/F_{baud_rate} + T_{ref_clk}$	—
UA4	Transmit IR Pulse Duration	$t_{TIRpulse}$	$(3/16)*(1/F_{baud_rate}) - T_{ref_clk}$	$(3/16)*(1/F_{baud_rate}) + T_{ref_clk}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency)/16.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

UART IrDA Mode Receiver

Figure 56 depicts the UART IrDA mode receive timing, with 8 data bit/1 stop bit format. Table 70 lists the receive timing characteristics.

Figure 56. UART IrDA Mode Receive Timing Diagram

Table 70. IrDA Mode Receive Timing Parameters

ID	Parameter	Symbol	Min	Max	Unit
UA5	Receive Bit Time ¹ in IrDA mode	t_{RIRbit}	$1/F_{baud_rate}^2 - 1/(16*F_{baud_rate})$	$1/F_{baud_rate} + 1/(16*F_{baud_rate})$	—
UA6	Receive IR Pulse Duration	$t_{RIRpulse}$	1.41 μ s	$(5/16)*(1/F_{baud_rate})$	—

¹ The UART receiver can tolerate $1/(16*F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16*F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency)/16.

4.10.12 USB HSIC Timings

This section describes the electrical information of the USB HSIC port.

NOTE

HSIC is DDR signal, following timing spec is for both rising and falling edge.

4.10.12.1 Transmit Timing

Tsetup	data setup time	365		ps	Measured at 50% point
Tslew	strobe/data rising/falling time	0.7	2	V/ns	Averaged from 30% – 70% points

¹ The timings in the table are guaranteed when:
—AC I/O voltage is between 0.9x to 1x of the I/O supply
—DDR_SEL configuration bits of the I/O are set to (10)b

4.10.13 USB PHY Parameters

This section describes the USB-OTG PHY and the USB Host port PHY parameters.

The USB PHY meets the electrical compliance requirements defined in the Universal Serial Bus Revision 2.0 OTG, USB Host.

5 Boot Mode Configuration

This section provides information on boot mode configuration pins allocation and boot devices interfaces allocation.

5.1 Boot Mode Configuration Pins

[Table 76](#) provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT_FUSE_SEL fuse. The boot option pins are in effect when BT_FUSE_SEL fuse is '0' (cleared, which is the case for an unblown fuse). For detailed boot mode options configured by the boot mode pins, see the i.MX 6SoloLite Fuse Map document and the System Boot chapter of the i.MX 6SoloLite reference manual.
