1 Introduction

V2DIP2-64 module is designed to allow rapid development of designs using the VNC2-64Q IC. The V2DIP2-64 is supplied as a PCB designed to fit into a 60 pin 0.8" wide, 0.1" pitch DIP socket. The module provides access to the UART, parallel FIFO, and SPI interface pins of the VNC2-64Q device, via its IO bus pins. Two USB ports are accessed via type A USB connectors.

Figure 1.1 - V2DIP2-64

The VNC2 is one of the family of Vinculum devices from FTDI : the second of FTDI's Vinculum family of Embedded dual USB host controller integrated circuit devices. The device is capable of handling the USB Host Interface for a variety of different USB device classes, e.g. BOMS (bulk only mass storage), Printer, HID (human interface device) etc. When interfacing to mass storage devices such as USB Flash drives, VNC2 also transparently handles the FAT File structure.

Communication with non USB devices such as a low cost microcontroller is accomplished via either UART, SPI or parallel FIFO interfaces using a simple to implement command set. VNC2 provides a new cost effective solution for providing USB Host capability into products that previously did not have the hardware resources available.

The device comes with a Debugger interface with bus master functionality and suite of tools which allows customers to create their own firmware (Compiler - Linker - Debugger - Assembler-IDE).

The Vinculum-II VNC2 family of devices are available in Pb-free (RoHS compliant) 32-lead LQFP, 32-lead QFN, 48-lead LQFP, 48-lead QFN, 64-Lead LQFP and 64-lead QFN packages

2 Features

The V2DIP2-64 incorporates the following features:

- Uses FTDI's VNC2-64Q embedded USB host controller IC device
- Two USB 'A' type socket to interface with USB peripheral devices
- UART, parallel FIFO and SPI interfaces can be programmed to a choice of available I/O pins
- Single 5V supply input from DIL connectors or 5V supplied via USB VBUS slave interface or debugger module.
- Auxiliary 3.3 V / 200 mA power output to external logic
- All VNC2 signals available on 0.8" wide, 0.1" pitch DIL male connectors.
- Power and traffic indicator LED's
- Debugger interface pin available on DIL pins or via 6 way male header which interfaces to separate debugger module
- Firmware upgrades via UART or debugger interface pin header
- V2DIP2-64 is a Pb-free, RoHS complaint development module
- FOC software development suite of tools to create customised firmware includes a Compiler, Linker, Debugger and Assembler all wrapped up in an easy to use Integrated Design Environment GUI.

3.4 UART Interface

When the data and control buses are configured in UART mode, the interface implements a standard asynchronous serial UART port with flow control. The UART can support baud rates from 300baud to 3Mbaud. The UART interface is described more fully in a Vinculum-II datasheet please refer to:- [FTDI website](#)

3.4.1 Signal Description – UART Interface

The UART signals can be programmed to a choice of available I/O pins. **Table 3.3** explains the available pins for each of the UART signals.

<i>Available Pins</i>	<i>Name</i>	<i>Type</i>	<i>Description</i>

3.6 Parallel FIFO Interface-Asynchronous Mode

The Parallel FIFO Asynchronous mode is functionally the same as the Parallel FIFO Interface present in VDIP2 has an eight bit data bus, individual read and write strobes and two hardware flow control signals.

3.6.1 Signal Description - Parallel FIFO Interface

The Parallel FIFO Interface signals can be programmed to a choice of available I/O pins. **Table 3.6** shows the Parallel FIFO Interface signals and the pins that they can be mapped.

<i>Available Pins</i>	<i>Name</i>	<i>Type</i>	<i>Description</i>
J2-18, J2-14, J1-17, J1-24, J1-29, J2-28, J2-23, J1-3, J1-7, J2-8, J2-4	fifo_data[0]	I/O	FIFO data bus Bit 0

Table 3.7 Asynchronous FIFO Mode Read Cycle Timing

In asynchronous mode an external device can control data transfer driving FIFO_WR# and FIFO_RD# inputs. In contrast to synchronous mode, in asynchronous mode the 245 FIFO module generates the output enable EN# signal. EN# signal is effectively the read signal RD#.

Current byte is available to be read when FIFO_RD# goes low. When FIFO_RD# goes high, FIFO_RXF# output will also go high. It will only become low again when there is another byte to read.

When FIFO_WR# goes low FIFO_TXE# flag will always go high. FIFO_TXE# goes low again only when there is still space for data to be written in to the module.

3.7 Parallel FIFO Interface-Synchronous Mode

The Parallel FIFO Synchronous mode has an eight bit data bus, individual read and write strobes, two hardware flow control signals, an output enable and a clock out.

The synchronous FIFO mode uses the parallel FIFO interface signals detailed in **Table 3.6** and additional two signals detailed in **Table 3.8**.

Available Pins	Name	Type	Description
J2-18, J2-14, J1-17, J1-24, J1-29, J2-28, J2-23, J1-3, J1-7, J2-8, J2-4	fifo_oe#	Output	FIFO Output Enable
J2-17, J1-14, J1-18, J1-26, J1-30, J2-27, J2-22, J1-4, J1-8, J2-7, J2-3	fifo_clkout	Output	FIFO Output Enable

3.7.1 Timing Diagram – Synchronous FIFO Mode Read and Write Cycle

When in Synchronous FIFO interface mode, the timing of a read and write operation on the FIFO interface are shown in **Figure 3.4** and **Table 3.9**

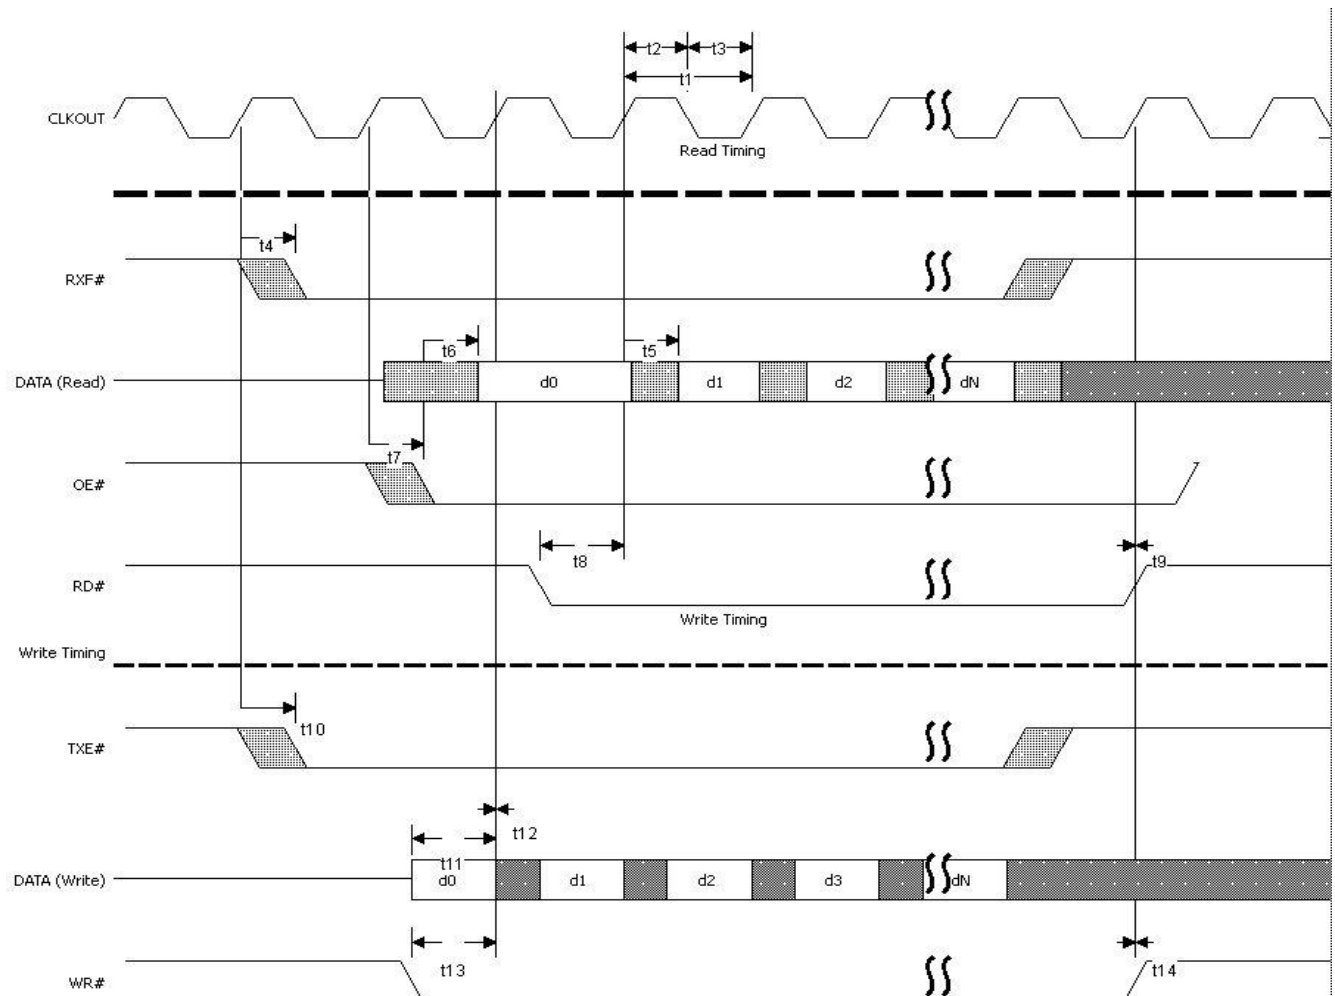

Figure 3.4 - Synchronous FIFO Mode Read and Write Cycle

<i>Time</i>	<i>Description</i>	<i>Min</i>	<i>Typical</i>	<i>Max</i>	<i>Uni</i>
t1	CLKOUT period	-	20.83	-	ns
t2	CLKOUT high period	9.38	10.42	11.46	ns
t3	CLKOUT low period	9.38	10.42	11.46	ns
t4	CLKOUT to RXF#	1	-	7.83	ns
t5	CLKOUT to read DATA valid	1	-	7.83	ns
t6	OE# to read DATA valid	1	-	7.83	ns
t7	CLKOUT to OE#	1	-	7.83	ns
t8	RD# setup time	12	-	-	ns
t9	RD# hold time	0	-	-	ns
t10	CLKOUT TO TXE#	1	-	-	ns
t11	Write DATA setup time	12	-	-	ns
t12	Write DATA hold time	0	-	-	ns
t13	WR# setup time	12	-	-	ns
t14	WR# hold time	0	-	-	ns

Table 3.9 - Synchronous FIFO Mode Read and Write Cycle Timing

In synchronous mode data can be transmitted to and from the FIFO module on each clock edge. An external device synchronises to the CLKOUT output and it also has access to the output enable OE# input to control data flow. An external device should drive output enable OE# low before pulling RD# line down.

When bursts of data are to be read from the module RD# should be kept low. RXF# remains low when there is still data to be read. Similarly when bursts of data are to be written to the module WR# should be kept low. TXE# remains low when there is still space available for the data to be written

3.8 Debugger Interface

The purpose of the debugger interface is to provide access to the VNC2 silicon/firmware debugger. The debug interface can be accessed via the appropriate pin on the DIL connector or more easily, it can be accessed by connecting a debug module to the J3 connector. This debug module will give access to the debugger through a USB connection to a PC via the Integrated Development Environment (IDE). The IDE is a graphical interface to the VNC2 software development tool-chain and gives the following debug capabilities through the debugger interface:

- Flash Erase, Write and Program.
- Application debug - application code can have breakpoints, be single stepped and can be halted. Detailed internal debug - memory and register read/write access.

The Debugger Interface, and how to use it, is further described in the following applications Note [Vinculum-II Debug Interface Description](#)

3.8.1 Signal Description - Debugger Interface

Table 3.10 shows the signals and pins description for the Debugger Interface pin header J3

<i>Pin No.</i>	<i>Name</i>	<i>Name On PCB</i>	<i>Type</i>	<i>Description</i>
J3-1	I00	DBG	I/O	Debugger Interface
J3-2	-	[Key]	-	Not connected. Used to make sure that the debug module is connected correctly.
J3-3	GND	GND	PWR	Module ground supply pin
J3-4	RESET#	RST#	Input	Can be used by an external device to reset the VNCL2. This pin is also used in combination with PROG# and the UART interface to program firmware into the VNC2.
J3-5	PROG#	PRG#	Input	This pin is used in combination with the RESET# pin and the UART interface to program firmware into the VNC2.
J3-6	5V0	VCC	PWR Input	5.0V module supply pin. This pin can be used to provide the 5.0V input to the V2DIP2-64 from the debugger interface when the V2DIP2-64 is not powered from the USB connector (VBUS) or the DIL connector pins J1-12, J1-13, J1-19 and J3-6.

4 Firmware

4.1 Firmware Support

The VNC2 on the V2DIP2-64 can be programmed with the customers own firmware created using the Vinculum II firmware development tool chain or with various pre-compiled firmware profiles to allow a designer to easily change the functionality of the chip. Please refer to:- [FTDI website](#) for full details on available pre-compiled firmware

4.2 Available Firmware

V2DAP firmware is currently available: USB Host for single Flash Disk and general purpose USB peripherals. Selectable UART, FIFO or SPI interface command monitor. please refer to:- [FTDI website](#) for full details.

4.3 Firmware Upgrades

Refer to the debugger interface section which can be used to update the firmware.
