### 1.0 GENERAL DESCRIPTION

This series of graphical $140 \times 32$ dot matrix Vacuum Fluorescent Display (VFD) modules are capable of displaying both graphics and text. The modules contain the VFD driver circuitry, microcontroller with built-in font tables, DC-DC converter, and serial and/or parallel interfaces.

### 1.1 INTERFACE OPTIONS

NAGP1250AB/BB-0: parallel and/or RS-232 level asynchronous serial communication NAGP1250AB/BB-2: parallel and/or synchronous or asynchronous CMOS level serial communication NAGP1250AB/BB-3: synchronous or asynchronous CMOS level serial communication

### 1.2 FEATURES

- 5VDC operation
- $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ operation
- $1000 \mathrm{~cd} / \mathrm{m}^{2}$ luminance and wide viewing angles
- Display both graphics and text simultaneously
- Fixed and proportional fonts for smoother character spacing
- 14 international font sets
- 8 levels of luminance control from $12.5 \%$ to $100 \%$
- Screen saver modes to reduce power consumption and to reduce image burn-in
- 4 User Windows in addition to the Base Window for quicker image updates
- Variable speed scrolling
- Choice of serial and/or parallel interfaces (input buffer shared when using 2 interfaces at once)

### 1.2.1 NEW FEATURES ADDED

- Increased size of Extended Memory from 116 to 140 columns allowing page swapping
- Increased number of user defined characters from 16 to 224 allowing an entire font table to be defined
- Increased user defined characters size from $5 x 7$ to $5 x 8$ allowing descenders (g, j, p, q, y)
- Added 3X and 4X vertical font magnification allowing up to 4X x 4X characters
- Added a 255 byte input buffer for increased communication speeds

### 2.0 APPLICABLE DOCUMENTS

| DATE PRINTED: |  |  |
| 17Oct12 |  | 6 OF 45 |

### 6.5 RESET TIMING SPECIFICATIONS

The module is reset automatically at power-up or by an external /RESET pulse. The module initializes to the same conditions as after the Initialize Display command, plus the input buffer is cleared.

| Item | Symbol | Min. | Typ. | Max. | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Delay from power-up or reset to DC/DC on | $\mathrm{t}_{\mathrm{DC} / \mathrm{DC}}$ | - | 25 | - | ms |
| Delay from power-up or reset to filament on | $\mathrm{t}_{\text {FIL }}$ | - | 25 | - | ms |
| Delay from power-up or reset to busy | $\mathrm{t}_{\text {DELAY }}$ | - | - | 2 | $\mu \mathrm{~s}$ |
| RESET low time | $\mathrm{t}_{\text {REL }}$ | 2.5 | - | - | $\mu \mathrm{s}$ |
| Busy time during initialization | $\mathrm{t}_{\text {BUSY }}$ | - | - | 50 | ms |
| Wait time before command byte | $\mathrm{t}_{\text {WAIT }}$ | 0 | - | s | ms |

Notes:

1) All timing is specified using $20 \%$ and $80 \%$ of $V_{C C}$ as the reference points.

| PART NUMBER: |
| :---: | :--- | :---: |
| NAGP1250AB-x/BB-x | REVISION: B. 1

### 6.6 SERIAL INTERFACE SPECIFICATIONS

Three serial interface options are available in the NAGP1250xx-x module series; CMOS level synchronous, CMOS level asynchronous and RS-232 level asynchronous. The options and baud rates are selected by module part number and jumper settings.

A 255 byte input buffer allows data to be sent to the module without monitoring the SBUSY output. However, the buffer may overflow if too many commands with long execution times are sent without waiting for them to execute. The SBUSY outputs an ACK pulse after each byte is received and remains active if the buffer is almost full indicating a busy condition. SBUSY remains active when the buffer can hold 16 or less additional bytes, this allows a host's 16 byte transmit buffer to be flushed without overflowing the input buffer.

| Item | Symbol | Min. | Typ. | Max. | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| SCK frequency | $1 / \mathrm{t}_{\text {SCK }}$ | - | - | 2.45 | MHz |
| SCK low time | $\mathrm{t}_{\text {SCKL }}$ | 163 | - | - | ns |
| SCK high time | $\mathrm{t}_{\text {SCKH }}$ | 163 | - | - | ns |
| SIN setup time | $\mathrm{t}_{\mathrm{DS}}$ | 50 | - | - | ns |
| SIN hold time | $\mathrm{t}_{\text {DH }}$ | 50 | - | - | ns |
| Delay time before SBUSY ACK pulse (Note 2) | $\mathrm{t}_{\text {DELAY }}$ | - | - | 60 | $\mu \mathrm{~s}$ |
| SBUSY ACK pulse width | $\mathrm{t}_{\text {ACK }}$ | 2.5 | 4.0 | 10.5 | $\mu \mathrm{~s}$ |
| Command execution time | $\mathrm{t}_{\text {EXEC. }}$ | See Command and Characters Section |  |  |  |
| Wait time before next command byte (Note 2) | $\mathrm{t}_{\text {WAIT }}$ | 0 |  | - | s |

Notes:

1) All timing is specified using $20 \%$ and $80 \%$ of $V_{C C}$ as the reference points.
2) Up to 20Khz data rate can be achieved by monitoring SBUSY in synchronous mode, data rate is limited by the baud rate in asynchronous mode.

CMOS level synchronous serial interface NAGP1250xx-2 and NAGP1250xx-3 (J2 shorted)

CMOS level asynchronous serial interface NAGP1250xx-2 and NAGP1250xx-3 (J2 open)
$\mathrm{SIN}_{-0}$

RS-232 level asynchronous serial interface NAGP1250xx-0 (J2 open)

| Asynchronous Parameter | Value |
| :--- | :---: |
| Baud rate | $9600,19200,38400,115200$ |
| Parity | no parity |
| Format | start (1 bit) + data (8 bits) + stop (1 bit) |
| Handshake | SBUSY |

### 6.7 PARALLEL INTERFACE SPECIFICATIONS

The parallel interface option is available on NAGP1250xx-0 and NAGP1250xx-2 modules. The parallel interface consists of an 8-bit data bus and /WR and /RD control inputs. Only bit D7 is bi-directional and is used to monitor the PBUSY output. PBUSY can also be read directly from a separate pin when jumper JB is shorted.

A 255 byte input buffer allows data to be sent to the module without monitoring the PBUSY output. However, the buffer may overflow if too many commands with long execution times are sent without waiting for them to execute. The PBUSY output goes high when data is latched in hardware by the rising edge of /WR, and goes low when data is read from the latch by the module software unless the buffer is almost full. PBUSY remains active when the buffer can only hold 16 or less additional bytes, indicating a busy condition, this allows a host's 16 byte transmit buffer to be flushed without overflowing the input buffer.

### 6.8 DISPLAY MEMORY

The Display Memory consists of 280x4 vertical bytes (280x32 bits) with each byte addressed by an X and Y pointer. The Display Memory is divided into 2 areas, the Standard Memory area ( 0,0 to 139,3 ) and the Extended Memory area (140,0 to 279,3).

|  |  | X |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 0 | 1 | --- | --- | 138 | 139 | 140 | 141 | --- | --- | 278 | 279 |
| Y | 0 | Standard Memory 140x4 bytes (140x32 bits) |  |  |  |  |  |  |  |  |  |  |  |
|  | 1 |  |  |  |  |  |  |  |  | nde | Me | ory |  |
|  | 2 |  |  |  |  |  |  |  | x4 | ytes | 140 | 32 b |  |
|  | 3 |  |  |  |  |  |  |  |  |  |  |  |  |

Display Memory is 280 x 4 bytes (280x32 bits)
Pixel data stored in the Standard Memory area is displayed on the VFD. Pixel data stored in the Extended Memory area can be displayed by scrolling it into Standard Memory area using the Display Memory Scroll command. For example, scrolling Display Memory data by 140 columns ( 560 bytes) would instantly change the displayed image to the pixel data that was in the Extended Memory area, i.e. "page swap". When scrolling pixel data from the Extended Memory area into the Standard Memory area, Standard Memory area data is scrolled back into the other end of the Extended Memory area (no data is lost).

### 6.9 WINDOWS

In addition to the Base Window, four User Windows can be defined anywhere in the Display Memory area (this includes the Extended Memory) and can overlap one another. Each window supports independent control and can be selected anytime.

### 6.9.1 BASE WINDOW

The Base Window (Window 0) is located either in the entire Standard Memory area between X,Y location 0,0 (upper left corner) and 139,3 (lower right corner), in the entire Extended Memory area between 140,0 and 279,3, or in the entire Display Memory area between 0,0 and 279,3.

### 6.9.2 USER WINDOWS

Each User Window (Window 1 to 4) is defined separately with an upper left corner and size anywhere within the Display Memory. User Windows can be re-defined anytime without affecting data stored in the Display Memory.

| PART NUMBER: | REVIIIION: |

### 6.10 COMMANDS AND CHARACTERS

Commands are sent to the module in single-byte or multi-byte command packets and characters are sent to the module as single-byte packets. Command codes range from 00 h to 1 Fh and character codes from 20h to FFh.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | --- |  |  |  |  |  |  |  | Command Packet Byte N |  |  |  |  |  |  |  |

| $1 \mathrm{Fh}+43 \mathrm{~h}$ | Cursor On / Off | n/a |
| $1 \mathrm{Fh}+58 \mathrm{~h}$ | Select Luminance Level | n/a |
| 1Fh +72 h | Reverse Video Write Mode Enable / Disable | n/a |
| 1Fh +73 h | Set Horizontal Scroll Speed | n/a |
| 1Fh + 77h | Select Write Logic Mode | n/a |
| 20h to FFh | Write Character | 170us to 6.2ms depending on size, mode, and cursor position |

Note: The module's 255 byte input buffer coupled with the maximum byte input rate of 20 KHz ( 50 us ) in parallel and synchronous serial modes or 115,200 baud (87us) in asynchronous serial mode allow most commands to be sent without monitoring the Busy output. The Busy output may need to be monitored depending on how many commands with long execution times are sent at once to avoid overflowing the input buffer. The Busy output toggles when room for 16 bytes remains in the input buffer allowing a host's 16 byte transmission buffer to be flushed after a Busy is detected.

| PART NUMBER: | REVIIION: |  |

### 6.10.1 BACKSPACE

This single-byte command packet backspaces the cursor one character position within the current window based on the current Cursor Mode (MD1, MD2, or MD3), the current Character Spacing and the current Font Magnification. This command only moves the cursor it does not erase any data.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Command <br> 08h |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

Width of the Backspace:

| Character Spacing | Font Magnification X | Width of the Backspace (columns) |
| :---: | :---: | :---: |
| (space after each character) | 1 | 6 |
|  |  | 2 |
|  | 3 | 12 |
|  |  | 4 |
| (space before and after each character) | 1 | 24 |
|  |  | 2 |

Backspace operation when Cursor Mode = Overwrite (MD1) or Vertical Scroll (MD2):

| Font Magnification Y | X Direction | Y Direction | Backspace Operation |
| :---: | :---: | :---: | :---: |
| $1,2,3$ or 4 rows | Space is available on the current row for the Backspace. | --- | 1) The cursor moves to the left the Width of the Backspace. |
|  | Space is not available on the current row for the Backspace. | Space is available for $1,2,3$ or 4 rows above the current row. <br> Current window is wide enough for the Backspace. | 1) The cursor moves to the column, the Width of the Backspace from the right end of the row $1,2,3$ or 4 rows above the current row. |
|  |  | Space is available for $1,2,3$ or 4 rows above the current row. <br> Current window is not wide enough for the Backspace. | 1) The cursor moves to the left end of the row $1,2,3$ or 4 rows above the current row. |
|  |  | Space is not available for $1,2,3$ or 4 rows above the current row. | 1) The cursor does not move. |

Backspace operation when Cursor Mode = Horizontal Scroll (MD3):

| Font Magnification Y | X Direction | Y Direction | Backspace Operation |
| :---: | :---: | :---: | :---: |
| $1,2,3$ or 4 rows | Space is available on the current <br> row for the Backspace. | --- | 1) The cursor moves to the left the <br> Width of the Backspace. |
|  | Space is not available on the current <br> row for the Backspace. | --- | 1) The cursor does not move. |

### 6.10.3 LINE FEED

This single-byte command packet performs a Line Feed. The cursor moves to a new row within the current window based on the current Cursor Mode (MD1, MD2, or MD3) and the current Font Magnification.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit <br> 0Amand |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |

Line Feed operation when Cursor Mode = Overwrite (MD1):

| Font Magnification Y | X Direction | Y Direction | Line Feed Operation |
| :---: | :---: | :---: | :---: |
| $1,2,3$ or 4 rows | --- | Space is available for 1,2,3 or 4 <br> rows below the current row. | 1) The cursor moves down 1, 2, 3 or 4 <br> rows <br> and remains in the <br> column. |
|  |  | Space is not available for 1, 2, 3 or 4 <br> rows below the current row. | 1) The cursor moves to the top row and <br> remains in the same column. |

Line Feed operation when Cursor Mode = Vertical Scroll (MD2):

| Font Magnification Y | X Direction | Y Direction | Line Feed Operation |
| :---: | :---: | :---: | :---: |
| $1,2,3$ or 4 rows | --- | Space is available for 1, 2, 3 or 4 <br> rows below the current row. | 1) The cursor moves down 1, 2, 3 or 4 <br> rows and remains in the same <br> column. |
|  |  |  | Space is not available for 1, 2, 3 or 4 <br> rows below the current row. |

Line Feed operation when Cursor Mode = Horizontal Scroll (MD3):

| Font Magnification Y | X Direction | Y Direction | Line Feed Operation |
| :---: | :---: | :---: | :---: |
| $1,2,3$ or 4 rows | --- | -- | $1)$ The cursor does not move. |

### 6.10.4 HOME POSITION

This single-byte command packet sets the Cursor Position to the upper left hand corner of the currently selected Window.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Command <br> 0Bh |  |  |  |  |  |  |  |

### 6.10.5 CLEAR WINDOW

This single-byte command packet clears the Display Memory of the currently selected Window and sets the Cursor Position to the upper left hand corner.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Command <br> 0Ch |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 |

### 6.10.6 CARRIAGE RETURN

This single-byte command packet sets the Cursor Position to the leftmost column of the current row of the currently selected Window.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit <br> 0.onand |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |

### 6.10.7 SELECT WINDOW 0

This single-byte command packet selects Window 0 as the current Window.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit       <br> Command       <br>        <br> 0       |  |  |  |  |  |  | 0 |

### 6.10.8 SELECT WINDOW 1

This single-byte command packet selects Window 1, if defined, as the current Window.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit <br> 11hand |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |

### 6.10.9 SELECT WINDOW 2

This single-byte command packet selects Window 2, if defined, as the current Window.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 8-bit <br> Command <br> 12h |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |

### 6.10.10 SELECT WINDOW 3

This single-byte command packet selects Window 3, if defined, as the current Window.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 8-bit <br> Command <br> 13h |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 |

### 6.10.11 SELECT WINDOW 4

This single-byte command packet selects Window 4, if defined, as the current Window.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit |  |  |  |  |  |  |  |
| Command |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 |

### 6.10.12 SELECT UDF CHARACTER SET

This three-byte command packet selects the UDF Character Set to be used when writing a character to Display Memory. An entire font table, 20h through FFh, can be defined by using all 16 UDF characters of all 14 UDF Character Sets. To disable writing UDF characters, select UDF Character Set 0.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | Command Packet Byte 3 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8 -bitCommand1 Bh |  |  |  |  |  |  |  | 8-bitCommand$25 h$ |  |  |  |  |  |  |  | 8-bit <br> UDF Character Set |  |  |  |  |  |  |  |

### 6.10.13 DEFINE UDF CHARACTER SET CHARACTERS

This multi-byte command packet defines up to 16 UDF characters in a UDF Character Set. The UDF characters are stored in volatile RAM and are undefined at power-up. The command terminates after all bytes are received or an error is detected.

Up to 16 UDF characters can be defined at once if the Character Codes for the UDF characters are numerically continuous. If not continuous, then a separate command needs to be used for each individual Character Code and/or group of Character Codes. Each of the UDF characters can be defined in either the $5 \times 8$ (which allows characters with descenders) or the 7 x 8 format.

After 16 UDF characters are defined in a UDF Character Set, any additional UDF characters must replace those already defined or some existing UDF characters must be deleted first.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | Command Packet Byte 3 |  |  |  |  |  |  |  | Command Packet Byte 4 |  |  |  |  |  |  |  |

### 6.10.15 INITIALIZE DISPLAY

This two-byte command packet resets the module to the conditions listed below which are the same as at power-up. This command does not clear the 255 byte input buffer.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit <br> Command <br> 1 Bh <br> 0 |  |  |  |  |  |  |  | 8-bit <br> Command <br> 40h <br> 0 |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |

## Reset Conditions:

Entire Display Memory cleared (Standard and Extended)
Base Window selected and defined from 0,0 to 139,3 with cursor at position 0,0
All User Windows deleted
Overwrite Mode (MD1) selected for all Windows
Write Logic Mode set to normal
Reverse Video Write Mode disabled
Font Magnification set to 1x1
Character Width / Spacing set to fixed width with left and right spaces
Font Set 0 selected for both 20h through 7Fh and 80h through FFh characters
All UDF characters deleted and UDF Character Set 0 selected (UDF's disabled)
Luminance set to $100 \%$
Cursor off
Horizontal Scroll Speed set to 0
Display Blink canceled
Switching power supply turned on

## 16-bit X Cursor Position (X15:X0):

Valid X Cursor Positions are based on the size of the currently selected window.

## 16-bit Y Cursor Position (Y15:Y0):

Valid Y Cursor Positions are based on the size of the currently selected window.
Note: After all command packet bytes are received, invalid values cause entire command packet to be ignored.

### 6.10.22 WAIT

This five-byte command packet is a waste of time. Command execution halts until the Wait Time elapses.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | Command Packet Byte 3 |  |  |  |  |  |  |  | Command Packet Byte 4 |  |  |  |  |  |  |  |

| Command Packet Byte 9 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 5-bit <br> Scroll Speed |  |  |  |  |  |  |  |
| S7 | S6 | S5 | S4 | S3 | S2 | S1 | S0 |

## 16-bit Number of Column Bytes to Scroll (C15:C0):

This number specifies how many Column Bytes to scroll Display Memory for each repetition. This number should be a multiple of 4 since there are 4 bytes of Display Memory per display column.
0 <= C value <= 1119

## 16-bit Number of Repetitions (R15:R0):

This number specifies how many times to repeat the scroll.
$1<=\mathrm{R}$ value <= 65535

## 8-bit Scroll Speed (S7:S0):

Scroll Speed is approximately 14ms * S per repetition.
$0<=S$ value <= 255
Note: An invalid value terminates the command packet at that byte. Subsequent bytes are considered part of the next command packet.

| :---: | :---: |
| NAGP1250AB-x/BB-x |$\underbrace{\text { REVISION: }}$

### 6.10.24 DISPLAY BLINK

This eight-byte command packet sets the display blinking parameters. The display will repeat the Normal / Blink Pattern cycle at the blink rate set by $\mathrm{T}_{1}$ and $\mathrm{T}_{2}$ indefinitely, or by the Number of Repetitions specified.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | Command Packet Byte 3 |  |  |  |  |  |  |  | Command Packet Byte 4 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bitCommand1 Fh |  |  |  |  |  |  |  | 8-bitCommand28 h |  |  |  |  |  |  |  | 8-bitCommand61 h |  |  |  |  |  |  |  | 8-bitCommand11 h |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |

| Command Packet Byte 5 |  |  |  |  |  |  |  | Command Packet Byte 6 |  |  |  |  |  |  |  | Command Packet Byte 7 |  |  |  |  |  |  |  | Command Packet Byte 8 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit <br> Blink Pattern |  |  |  |  |  |  |  | $\begin{gathered} \text { 8-bit } \\ \mathrm{T}_{1}=\text { Time of Normal Pattern } \end{gathered}$ |  |  |  |  |  |  |  | 8-bit <br> $\mathrm{T}_{2}=$ Time of Blink Pattern |  |  |  |  |  |  |  | 8-bit <br> Number of Repetitions |  |  |  |  |  |  |  |
| P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 | T17 | T16 | T 5 | T14 | $\mathrm{T}_{1} 3$ | T12 | $\mathrm{T}_{1} 1$ | $\mathrm{T}_{1} 0$ | T27 | T26 | $\mathrm{T}_{2} 5$ | T24 | T23 | $\mathrm{T}_{2} 2$ | T21 | $\mathrm{T}_{2} 0$ | R7 | R6 | R5 | R4 | R3 | R2 | R1 | R0 |

## 8-bit Blink Pattern (P7:P0):

0 Normal display pattern during period $\mathrm{T}_{2}$
1 Blank display pattern during period $\mathrm{T}_{2}$
2 Reverse Video display pattern during period $\mathrm{T}_{2}$
$0<=\mathrm{P}$ value <= 2

## 8-bit Time of Normal Pattern ( $\mathrm{T}_{1} 7: \mathrm{T}_{\mathbf{1}} 0$ ):

Normal Pattern is displayed approximately 14 ms * $\mathrm{T}_{1}$ per cycle.
$1<=\mathrm{T}_{1}$ value <= 255
8-bit Time of Blink Pattern ( $\left.\mathrm{T}_{2} 7: \mathrm{T}_{\mathbf{2}} \mathbf{0}\right)$ :
Blink Pattern is displayed approximately $14 \mathrm{~ms} * \mathrm{~T}_{2}$ per cycle.
$1<=\mathrm{T}_{2}$ value <= 255

## 8-bit Number of Repetitions (R7:R0):

This number specifies how many times to repeat the Normal / Blink Pattern cycle.
0 Command execution continues and the cycle repeats until the Number of Repetitions is changed by another Display Blink command or the Initialize command. Command execution is not interrupted.
$>0$ Command execution halts until the Number of Repetitions is reached.
$0<=\mathrm{R}$ value <= 255

Note: An invalid value terminates the command packet at that byte. Subsequent bytes are considered part of the next command packet.

## 16-bit Image Size X (X15: X0):

This is the number of columns in the Graphic Image.
$1<=$ X value <= 280

## 16-bit Image Size Y (Y15: Y0):

This is the number of rows in the Graphic Image.
$1<=$ Y value <= 4

## 8-bit Image Mode (IM7:IM0):

1 Fixed Mode
1 <= IM value <= 1

## 8-bit Image Data (D7:D0):

The Graphic Image is written to Display Memory as the Image Data bytes are received starting from the current cursor location filling each row of a column of the Graphic Image from top to bottom, from the left to the right column. The MSB of Image data represents the upper pixel of each byte in a column.
$0<=\mathrm{D}$ value $<=255$
Note: An invalid value terminates the command packet at that byte. Subsequent bytes are considered part of the next command packet.

### 6.10.27 SELECT CHARACTER WIDTH / CHARACTER SPACING

This five-byte command packet selects the Character Width and Charter Spacing to be used when writing characters to Display Memory.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | Command Packet Byte 3 |  |  |  |  |  |  |  | Command Packet Byte 4 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bitCommand1 Fh |  |  |  |  |  |  |  | 8-bitCommand28 h |  |  |  |  |  |  |  | 8-bitCommand67 h |  |  |  |  |  |  |  | 8-bitCommand03 h |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

| Command Packet Byte 5 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit |  |  |  |  |  |  |  |
| Width / Spacing |  |  |  |  |  |  |  |
| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

## 8-bit Width / Spacing (D7:D0):

0 Fixed Character Width and a space on the right side of each character.
1 Fixed Character Width and a space on the left and right sides of each character.
2 Proportional Character Width and a space on the right side of each character.
3 Proportional Character Width and a space on the left and right sides of each character.
$0<=$ D value <= 3
Note: Invalid values are ignored.

### 6.10.27.1 CHARACTER WIDTH / CHARACTER SPACING EXAMPLES

Fixed $5 \times 7$ character width with right space

Proportional 5x7 character width with left and right spaces

Proportional $5 x 7$ character width with right space

Note:

1) The descender of the lower case " $g$ " requires a $5 x 8$ UDF charcter.

Notes:

1) Only the left most 6 columns of a $7 x 8$ UDF are displayed with right space spacing.
2) Fixed / Proportional Width setting is ignored by 7x8 UDF characters.

## 8-bit Reverse Video Write Mode (R7:R0):

0 Disabled
1 Enabled
$0<=\mathrm{R}$ value <= 1
Note: Invalid values are ignored.

| PART NUMBER: | REVIIION: |  |
| :---: | :--- | :---: |
| NAGP1250AB-x/BB-x |  | B. 1 |
| DATE PRINTED: |  |  |
| $170 c t 12$ | SHEET: | 39 OF 45 |

### 6.10.35 SET HORIZONTAL SCROLL SPEED

This three-byte command packet sets the Horizontal Scroll Speed for the MD3 mode.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | Command Packet Byte 3 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bitCommand1 Fh |  |  |  |  |  |  |  | 8-bitCommand73 h |  |  |  |  |  |  |  | 8-bitHorizontal Scroll Speed |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | S7 | S6 | S5 | S4 | S3 | S2 | S1 | S0 |

## 8-bit Horizontal Scroll Speed (S7:S0):

Horizontal Scroll Speed is approximately S * 14ms per column.
$0<=$ S value <= 31
Note: Invalid values are ignored.

### 6.10.36 SELECT WRITE LOGIC MODE

This three-byte command packet selects the Write Logic Mode. As character data or graphic data is written it is logically combined with the data already in the Display Memory.

| Command Packet Byte 1 |  |  |  |  |  |  |  | Command Packet Byte 2 |  |  |  |  |  |  |  | Command Packet Byte 3 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bitCommand1Fh |  |  |  |  |  |  |  | 8-bitCommand77h |  |  |  |  |  |  |  | 8-bit <br> Write Logic Mode |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | L7 | L6 | L5 | L4 | L3 | L2 | L1 | L0 |

8-bit Write Logic Mode (L7:L0):
0 Normal (overwrites existing data)
1 OR (combines new and existing data)
2 AND (masks existing data)
3 XOR (inverts existing data when new data is 0 xFF )
$0<=$ L value <= 3
Note: Invalid values are ignored.

### 6.10.37 WRITE CHARACTER

This single-byte command packet writes the specified character to Display Memory at the Cursor Position in the currently selected Window based on the current Cursor Mode (MD1, MD2, or MD3), the current Character Width and Spacing and the current Font Magnification. The character is taken from selected Font Set unless it is redefined and enabled as a UDF.

| Command Packet Byte 1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit |  |  |  |  |  |  |  |
| Character Number |  |  |  |  |  |  |  |
| 20h to FFh |  |  |  |  |  |  |  |
| C7 | C6 | C5 | C4 | C3 | C2 | C1 | C0 |

Write Character operation when Cursor Mode = Overwrite (MD1):

| PART NUMBER: |  |  |
| :---: | :--- | :---: |
| NAGP1250AB-x/BB-x |  | REVIIION: |
| DATE PRINTED: 17 Oct12 | SHEET: |  |
|  |  | 41 OF 45 |

Write Character operation when Cursor Mode = Vertical Scroll (MD2):

| PART NUMBER: |  |  |
| :---: | :--- | :---: |
| NAGP1250AB-x/BB-x |  | REVIIION: |
| DATE PRINTED: $170 \mathrm{Ct12}$ | SHEET: |  |
|  |  | 42 OF 45 |

Write Character operation when Cursor Mode = Horizontal Scroll (MD3):

| Font Magnification Y | X Direction | Y Direction | Write Character Operation |
| :---: | :---: | :---: | :---: |
| $1,2,3$ or 4 rows | Space is available on the current row for the character and the cursor. | --- | 1) The character is written at the current cursor position. <br> 2) The cursor moves to the right of the new character. |
|  | Space is available on the current row for the character but not the cursor. | --- | 1) The character is written at the current cursor position. <br> 2) The cursor moves to the right end of the current row. |
|  | Space is available on current row for some of the character. | --- | 1) As much of the character that fits on the current row is written at the current cursor position. <br> 2) The displayed pattern on the current row and the 1,2 or 3 rows below are scrolled left, filling the rightmost column with the rest of the character data. <br> 3) The cursor moves to the right end of the current row. |
|  | The cursor is at the right end of the current row. | --- | 1) The displayed pattern on the current row and the 1,2 or 3 rows below are scrolled left, filling the rightmost column with character data. <br> 2) The cursor moves to the right end of the current row. |

### 7.0 CONNECTORS AND JUMPERS

Contact Futaba for customer specified connector and/or cable options and factory preconfigured jumper settings.

### 7.1 CN1 - PARALLEL INTERFACE

The parallel interface, CN1, consists of 14 plated through holes in the PCB, in a 1 x 14 or 2 x 7 array depending on the module version.

| Pin | Signal | Pin | Signal |
| :---: | :---: | :---: | :---: |
| 1 | GND | 8 | D1 |
| 2 | V $_{\text {CC }}$ | 9 | D2 |
| 3 | $/$ RESET or PBUSY | 10 | D3 |
| 4 | no internal connection | 11 | D4 |
| 5 | $/$ WR | 12 | D5 |
| 6 | $/$ RD | 13 | D6 |
| 7 | D0 | 14 | D7 and PBUSY |

### 7.2 CN2 - SERIAL INTERFACE

The serial interface, CN2, consists of 6 plated through holes in the PCB, in a 1x6 array.

| Pin | Signal |
| :---: | :---: |
| 1 | V CC |
| 2 | SIN |
| 3 | GND |
| 4 | SBUSY |
| 5 | SCK |
| 6 | /RESET |

| PART NUMBER: | REVISION: |  |
| :---: | :--- | :---: |
| NAGP1250AB-x/BB-x |  | B. 1 |
| DATE PRINTED: | SHEET: |  |
| $170 c t 12$ |  | 44 OF 45 |

### 7.3 JRB - SIGNAL SELECT FOR CN1 PIN 3

The signal select, JRB, consists of 3 plated through holes in the PCB, in a 1x3 array. Connecting pin 1 to pin 2 routes the /RESET signal to CN1 pin 3, likewise connecting pin 3 to pin 2 routes the PBUSY signal to CN1 pin 3. Similarly, either jumper JR or JB can be placed to route a signal to CN1 pin 3.

| Pin | Signal |
| :---: | :---: |
| 1 | /RESET |
| 2 | CN1 pin 3 |
| 3 | PBUSY |

Note: Do not route both signals to CN1 pin 3 at once or connect them together.

### 7.4 JUMPERS J0 THROUGH J3

These jumpers are used to select module options.

| J0 | J1 | J2 | J3 | Function |
| :---: | :---: | :---: | :---: | :---: |
| open | open | open | X | Asynchronous serial at 38400 baud |
| shorted | open |  | X | Asynchronous serial at 19200 baud |
| open | shorted |  | X | Asynchronous serial at 9600 baud |
| shorted | shorted |  | X | Asynchronous serial at 115200 baud |
| X | X | shorted | X | Synchronous serial |
| X | X | X | shorted | Self-test image displayed at power-up and after a reset for about 4 seconds before the all dots on screen saver is displayed. (image includes software revision) |
