

100V 50mA Very High Voltage LDO

General Description

The GM7A4001 device is a very high voltage-tolerant linear regulator that offers the benefits of a thermally-enhanced package, and is able to withstand continuous DC or transient input voltages of up to 100 V. The GM7A4001 device is stable with output capacitance greater than 2.2 μ F and any input capacitance greater than 0.47 μ F. Therefore, implementations of this device require minimal board space because of its miniaturized packaging (MSOP8-EP) and a potentially small output capacitor. In addition, the GM7A4001 device offers an enable pin (EN) compatible with standard CMOS logic to enable a low-current shutdown mode.

The GM7A4001 device has an internal thermal shutdown and current limiting to protect the system during fault conditions. The SOP8-EP and MSOP8-EP packages have an operating temperature range of $T_J = -40^{\circ}\text{C}$ to 125°C . In addition, the GM7A4001 device is ideal for generating a low-voltage supply from intermediate voltage rails in telecom and industrial applications; not only can it supply a well-regulated voltage rail, but it can also withstand and maintain regulation during very high and fast voltage transients. These features translate to simpler and more cost-effective electrical surge-protection circuitry for a wide range of applications, including PoE, bias supply, and LED lighting.
