

◆ General Description

The GH266A is an integrated Hall sensor with output driver designed for electronic commutation of brush-less DC motor applications. The device includes an on-chip Hall sensor for magnetic sensing, an amplifier that amplifies the Hall voltage, a wave shaping circuit to provide switching hysteresis for noise rejection and two complementary open-drain drivers for sinking large load current. It also includes an internal voltage regulator which allows a wide operating supply voltage ranges.

Placing the device in a variable magnetic field, if the magnetic flux density is larger than threshold B_{OP} , the pin OUT1 will be turned low (on) and pin OUT2 will be turned high (off). This output state is held until the magnetic flux density reverses and falls below B_{RP} , then causes OUT1 to be turned high (off) and OUT2 turned low (on). GH266A is

rated for operation over temperature range from -40°C to $+85^{\circ}\text{C}$ and voltage range from 3.5V to 28V.

The GH266A is available in TO-94 (SIP-4L) package.

Note:

1. D1 is an ordinary diode used to filter the noise from VDD and It is optional.
2. C1=C2=C3=2.2µF typical, electrolytic capacitors are better. They should be fine tuned based on system design.
3. R2=R3=4.7Ω typical. They can be cancelled according to system requirement.
