# LM1575/LM2575/LM2575HV <br> SIMPLE SWITCHER ${ }^{\circledR}$ 1A Step-Down Voltage Regulator 

## General Description

The LM2575 series of regulators are monolithic integrated circuits that provide all the active functions for a step-down (buck) switching regulator, capable of driving a 1 A load with excellent line and load regulation. These devices are available in fixed output voltages of $3.3 \mathrm{~V}, 5 \mathrm{~V}, 12 \mathrm{~V}, 15 \mathrm{~V}$, and an adjustable output version.
Requiring a minimum number of external components, these regulators are simple to use and include internal frequency compensation and a fixed-frequency oscillator.
The LM2575 series offers a high-efficiency replacement for popular three-terminal linear regulators. It substantially reduces the size of the heat sink, and in many cases no heat sink is required.
A standard series of inductors optimized for use with the LM2575 are available from several different manufacturers. This feature greatly simplifies the design of switch-mode power supplies.
Other features include a guaranteed $\pm 4 \%$ tolerance on output voltage within specified input voltages and output load conditions, and $\pm 10 \%$ on the oscillator frequency. External shutdown is included, featuring $50 \mu \mathrm{~A}$ (typical) standby current.

## Features

- $3.3 \mathrm{~V}, 5 \mathrm{~V}, 12 \mathrm{~V}, 15 \mathrm{~V}$, and adjustable output versions
- Adjustable version output voltage range, 1.23 V to 37 V ( 57 V for HV version) $\pm 4 \%$ max over line and load conditions
- Guaranteed 1A output current
- Wide input voltage range, 40 V up to 60 V for HV version
- Requires only 4 external components
- 52 kHz fixed frequency internal oscillator
- TTL shutdown capability, low power standby mode
- High efficiency

■ Uses readily available standard inductors

- Thermal shutdown and current limit protection
- $\mathrm{P}^{+}$Product Enhancement tested

## Applications

■ Simple high-efficiency step-down (buck) regulator

- Efficient pre-regulator for linear regulators
- On-card switching regulators
- Positive to negative converter (Buck-Boost)

## Typical Application (Fixed Output Voltage <br> Versions)

## Block Diagram and Typical Application

$3.3 \mathrm{~V}, \mathrm{R} 2=1.7 \mathrm{k}$
$5 \mathrm{~V}, \mathrm{R} 2=3.1 \mathrm{k}$
$12 \mathrm{~V}, \mathrm{R} 2=8.84 \mathrm{k}$
$15 \mathrm{~V}, \mathrm{R} 2=11.3 \mathrm{k}$
For ADJ. Version
R1 $=$ Open, R2 $=0 \Omega$
Note: Pin numbers are for the TO-220 package.

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics.
Note 2: All limits guaranteed at room temperature (standard type face) and at temperature extremes (bold type face). All limits are used to calculate Average Outgoing Quality Level, and all are 100\% production tested.
Note 3: All limits guaranteed at room temperature (standard type face) and at temperature extremes (bold type face). All room temperature limits are 100\% production tested. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control (SQC) methods.

Note 4: External components such as the catch diode, inductor, input and output capacitors can affect switching regulator system performance. When the LM1575/LM2575 is used as shown in the Figure 2 test circuit, system performance will be as shown in system parameters section of Electrical Characteristics.
Note 5: Output (pin 2) sourcing current. No diode, inductor or capacitor connected to output pin.
Note 6: Feedback (pin 4) removed from output and connected to OV.
Note 7: Feedback (pin 4) removed from output and connected to +12 V for the Adjustable, 3.3 V , and 5 V versions, and +25 V for the 12 V and 15 V versions, to force the output transistor OFF.
Note 8: $\mathrm{V}_{\mathrm{IN}}=40 \mathrm{~V}$ ( 60 V for the high voltage version).
Note 9: Junction to ambient thermal resistance (no external heat sink) for the 5 lead TO-220 package mounted vertically, with $1 / 2$ inch leads in a socket, or on a PC board with minimum copper area.
Note 10: Junction to ambient thermal resistance (no external heat sink) for the 5 lead TO- 220 package mounted vertically, with $1 / 2$ inch leads soldered to a PC board containing approximately 4 square inches of copper area surrounding the leads.
Note 11: Junction to ambient thermal resistance with approximately 1 square inch of pc board copper surrounding the leads. Additional copper area will lower thermal resistance further. See thermal model in Switchers made Simple software.
Note 12: If the TO-263 package is used, the thermal resistance can be reduced by increasing the PC board copper area thermally connected to the package: Using 0.5 square inches of copper area, $\theta_{\mathrm{JA}}$ is $50^{\circ} \mathrm{C} / \mathrm{W}$; with 1 square inch of copper area, $\theta_{\mathrm{JA}}$ is $37^{\circ} \mathrm{C} / \mathrm{W}$; and with 1.6 or more square inches of copper area, $\theta_{\mathrm{JA}}$ is $32^{\circ} \mathrm{C} / \mathrm{W}$.

Note 13: The oscillator frequency reduces to approximately 18 kHz in the event of an output short or an overload which causes the regulated output voltage to drop approximately $40 \%$ from the nominal output voltage. This self protection feature lowers the average power dissipation of the IC by lowering the minimum duty cycle from $5 \%$ down to approximately $2 \%$.

Typical Performance Characteristics (Circuit of Figure 2)

Typical Performance Characteristics (Circuit of Figure 2) (Continued)

Switch Saturation Voltage

Typical Performance Characteristics (Circuit of Figure 2) (Continued)

AC-Coupled
Horizontal Time Base: $5 \mu \mathrm{~s} / \mathrm{div}$

## Test Circuit and Layout Guidelines

As in any switching regulator, layout is very important. Rapidly switching currents associated with wiring inductance generate voltage transients which can cause problems. For minimal inductance and ground loops, the length of the leads indicated by heavy lines should be kept as short as possible.

## Maximum Power Dissipation

(TO-263) (See (Note 12))

Load Transient Response

Single-point grounding (as indicated) or ground plane construction should be used for best results. When using the Adjustable version, physically locate the programming resistors near the regulator, to keep the sensitive feedback wiring short.

## Test Circuit and Layout Guidelines (Continued)

$\mathrm{C}_{\mathrm{IN}}-100 \mu \mathrm{~F}, 75 \mathrm{~V}$, Aluminum Electrolytic
$C_{\text {OUt }}-330 \mu \mathrm{~F}, 25 \mathrm{~V}$, Aluminum Electrolytic
D1 - Schottky, 11DQ06
L1 - $330 \mu \mathrm{H}, \mathrm{PE}-52627$ (for 5V in, 3.3V out, use $100 \mu \mathrm{H}$, PE-92108)

where $\mathrm{V}_{\mathrm{REF}}=1.23 \mathrm{~V}$, R 1 between 1 k and 5 k .
R1 - 2k, 0.1\%
R2 - 6.12k, 0.1\%
