DC-to-DC Converter Control Circuits

DESCRIPTION

The MC33063 series is a monolithic control circuit containing primary functions required for DC-to-DC converters.

These devices consist of an internal temperature-compensated reference, comparator, controlled duty cycle oscillator with an active current limit circuit, driver and high current output switch. This series was specifically designed to be incorporated in step-down and step-up and voltage-inverting applications with a minimum number of external components.

ORDERING INFORMATION

| DEVICE	Package Type	MARKING	Packing	Packing Qty
MC33063N	DIP8	MC33063	TUBE	2000/box
MC33063M/TR	SOP8	MC33063	REEL	2500/reel

FEATURES

- Operation from 3.0V to 40V input
- Low standby current
- Current limiting
- Output switch current up to 1.5A
- Adjustable output voltage
- Operation at frequencies up to 100kHz
- Precision reference (2%)

Notes:

1. Maximum package power dissipation limits must be observed.
2. Low duty cycle pulse techniques are used during the test to maintain the junction temperature as close to the ambient temperature as possible.

TERMS AND DEFINITIONS

V_{sat} – Saturation voltage of the output switch.

V_F – Forward voltage drop of the output rectifier.

The following power supply characteristics must be chosen:

V_{in} – Nominal input voltage.

V_{out} – Desired output voltage, $\left|V_{out}\right| = 1.25\left(1 + \dfrac{R_2}{R_1}\right)$

f_{min} – Minimum desired output switching frequency at the selected values of V_{in} and I_{out}.

$V_{ripple(p-p)}$ – Desired peak-to-peak output ripple voltage. In practice, the calculated capacitor value will need to be increased due to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
