General Description

The OP27 has very low input offset voltage (50 μ V) maximum that is obtained by trimming at the wafer stage. These low offset voltages generally eliminate any need for external nulling. The OP27 also features low input bias current and high open-loop gain. The low offset and high open-loop gain make the OP27 particularly useful for high gain instrumentation applications. The wide input voltage range combined with a high CMRR of 106 dB and high input impedance provide high accuracy in the noninverting circuit configuration. Excellent linearity and gain accuracy can be maintained even at high closed-loop gains. Stability of offsets and gain with time or variations in temperature is excellent. The accuracy and stability of the OP27, even at high gain, combined with the freedom from external nulling have made the OP27 an ideal choice for instrumentation applications. The OP27 is available in epoxy 8-lead PDIP and 8-lead narrow SOP and MSOP packages.

2.0 Product Specification

2.1 Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.
