

Pulse Width Modulation Control Circuit

Features

- 8.0V to 35V Operation
- 5.0V \pm 1% Trimmed Reference
- 1.0Hz to 400KHz Oscillator Range
- Dual Source/Sink Current Outputs: \pm 100mA
- Digital Current Limiting
- Programmable Dead Time
- Undervoltage-Lockout
- Single Pulse Metering
- Programmable Soft-Start
- Wide Current Limit Common Mode Range
- Guaranteed 6 Unit Synchronization

General Description

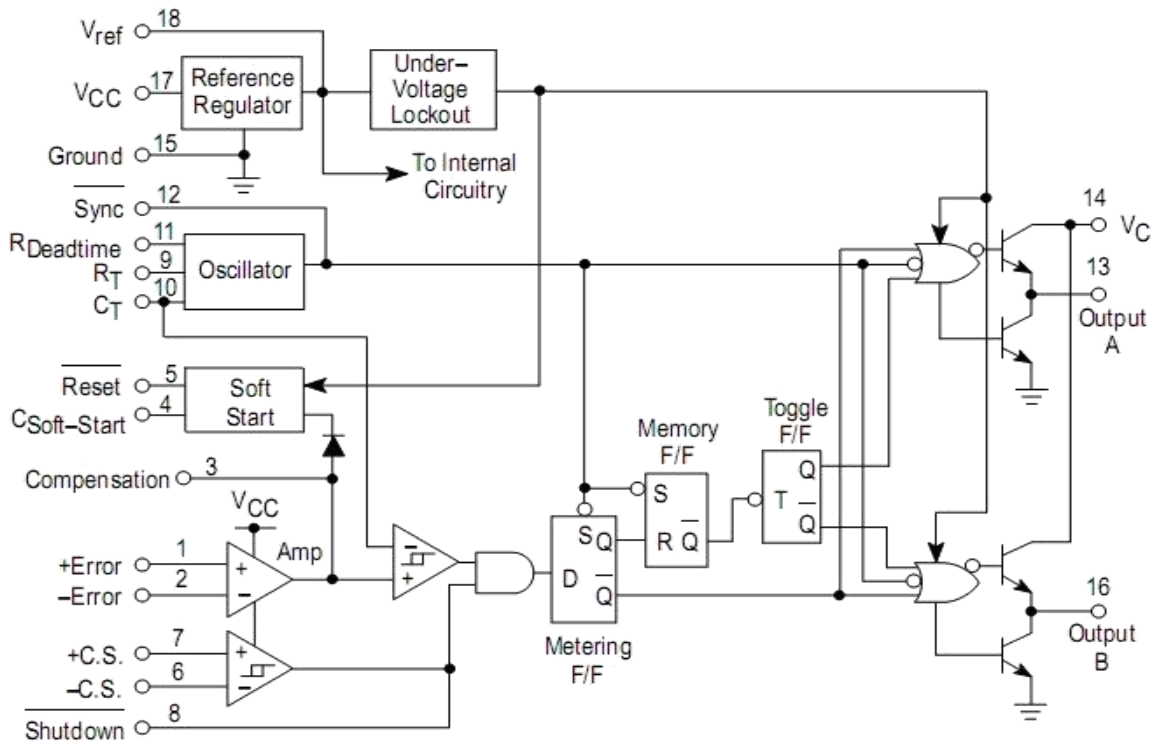

The SG3526 is a high performance pulse width modulator integrated circuit intended for fixed frequency switching regulators and other power control applications.

Functions included in this IC are a temperature compensated voltage reference, sawtooth oscillator, error amplifier, pulse width modulator, pulse metering and steering logic, and two high current totem pole outputs ideally suited for driving the capacitance of power FETs at high speeds.

Additional protective features include soft start and undervoltage lockout, digital current limiting, double pulse inhibit, adjustable deadtime and a data latch for single pulse metering;. All digital control ports are TTL and B-series CMOS compatible. Active low logic design allows easy wired-OR connections for maximum flexibility. The versatility of this device enables implementation or transformer coupled.

The metering Flip-Flop is an asynchronous data latch which suppresses high frequency oscillations by allowing only one PWM pulse per oscillator cycle.

The memory Flip-Flop prevents double pulsing in a push-pull configuration by remembering which output produced the last pulse.
