SCX Series

Precision Compensated Pressure Sensors

The SCX series sensors provides a very cost effective solution for pressure applications that require high accuracy over a wide temperature range. These internally calibrated and temperature compensated sensors were specifically designed to provide an accurate and stable output over a 0°C to 70°C temperature range. This series is intended for use with non-corrosive, non-ionic working fluids such as air, dry gases and the like.

Devices are available to measure absolute, differential and gauge pressures from 1 psi (SCX01) up to 150 psi (SCX150). The Absolute (A) devices have an internal vacuum reference and an output voltage proportional to absolute pressure. The Differential (D) devices allow application of pressure to either side of the pressure sensing diaphragm and can be used for gauge or differential pressure measurements.

The SCX devices feature an integrated circuit sensor element and laser trimmed thick film ceramic housed in a compact nylon case. This package provides isolation to external package stresses and has convenient mounting holes and pressure ports for ease of use with standard plastic tubing for pressure connection.

All SCX devices are calibrated for span to within $\pm 1\%$ and provide a very low zero pressure output of ± 300 microvolts maximum. Thus, for many applications, no trimming networks are required in the signal conditioning circuitry. If the application requires extended temperature range operation beyond 0°C to 70°C, two pins which provide an output voltage proportional to temperature are available for use with external circuitry.

The output of the bridge is ratiometric to the supply voltage and operation from any DC supply voltage up to +20V is acceptable.

Because these devices have very low noise and excellent temperature compensation, they are ideal for medical and other high performance applications. The 100 microsecond response time also makes this series an excellent choice for computer peripherals and pneumatic control applications.

SPECIFICATION NOTES (all devices)

- Note 1: Reference Conditions: Unless otherwise noted: Supply Voltage, V_S=12Vdc, T_A=25°C, Common Mode Line pressure=0 psig, Pressure Applied to Port B. For absolute devices only, pressure is applied to Port A and the output polarity is reversed.
- Note 2: Full-Scale Span is the algebraic difference between the output voltage at fullscale pressure and the output at zero pressure. Full-Scale Span is ratiometric to the supply voltage.
- Note 3: Pressure Hysteresis the maximum output difference at any point within the operating pressure range for increasing and decreasing pressure. Pressure Non-Linearity – the maximum deviation of measure output, at constant temperature (25°C), from "best straight line" through three points (offset pressure, full-scale pressure, one-half full-scale pressure).
- Note 4: Maximum error band of the offset voltage and the error band of the span, relative to the 25°C reading.
- Note 5: Maximum difference in output at any pressure within the operating pressure range and the temperature within 0°C to +70°C after: a) 100 temperature
 - cycles, 0°C to +70°C b) 1 million pressure cycles, 0 psi to full-scale
- Note 6: Input resistance is the resistance between pins 2 and 4

span.

- Note 7: Output resistance is the resistance between pins 3 and 5.
- Note 8: Common Mode voltage of the output arms (Pins 3 and 5) for V_S=12Vdc.
- Note 9: Response time for a 0 psi to full-scale span pressure step change, 10% to 90% rise time.
- Note 10: Long term stability over a one year period.
- Note 11: Maximum zero pressure offset for absolute device is $0 \pm 500 \mu$ V.
