## 8. 操作注意事项 Operating Precautions

### 8.1 极性 Polarity

CAP是具有正负极的固态铝电解电容，使用中不可反接，若接反，则电容会因为漏电流不断增大或短路而造成寿命缩短。

CAP is a solid aluminum electrolytic capacitor with positive and negative electrodes. Do not reverse the polarity when using. If it is used with the polarities reversed, its life may shorten because of increasing leakage current or short circuit.

### 8.2 禁止电路 Prohibited circuits

因为焊接及其它动作可造成电容的漏电流增加，CAP不可使用在下列电路中：

Since problems can be expected due to leakage current increasing during soldering and other processes, CAP cannot be used in the following circuits

- 1) 高阻抗电路 1) High impedance circuits;
- 2) 耦合电路 2) Coupling circuits;
- 3) 时限恒量电路 3) Time constant circuits;
- 4) 为提高耐电压而串联两个或多个电容于电路中
- 4) Connection of two or more capacitors in series for higher withstand voltage;
- 5) 电路因漏电流过大而有坏的影响 5) Circuits to get bad influence by big leakage current

\* 除漏电流的波动上升外，电容的使用条件如在承认书中规定的高温和低温，温热和耐受性条件都会影响电容量。若电容作为时限恒量电容使用，因其对电容量的变动的敏感性，电容量的改变会造成影响。不要将其作为时限恒量电容使用，同时若因电压原因要串联多个CAP电容，请联系东莞市荣誉电子有限公司。

\* In addition to the leakage current fluctuation above, the operational conditions such as characteristics at high and low temperature, damp heat and endurance stipulated in the specifications will affect the capacitance. The fluctuation of the capacitance may cause problem if it is used as a time constant capacitor, which is extremely sensitive to the fluctuation of the capacitance. Do not use it as a time constant capacitor. Additionally, please contact Donguan Honor Electronics Co., Ltd. for usage of two or more CAP in series for voltage proof.

### 8.3 电压 Over voltage

电压若超过额定电压，即便只是一瞬间也可能造成短路

Over voltage exceeding the rated voltage may not be applied even for an instant as it may cause a short circuit.

### 8.4 突然充放电 Sudden charge and discharge

突然的充放电是不可取的（为了维持高的可靠性）。为防止突然的充放电造成电容短路或漏电过大，电路中应加上一个保护电路用以分流过大的电流。若瞬间电流超过10A或超过10倍允许纹波电流，要使用保护电路。在测试漏电流时请加上一个 $1k\Omega$ 的电阻用以充放电。

Sudden charge and discharge restricted(for maintenance of high-proof reliability). A protection circuit is recommended for when a sudden charge or discharge causes excessive rush current because this is a main cause of short circuits and large leakage current. Use protection circuits if the rush current exceeds 10A. The rush current exceeds 10×the maximum allowable ripple current of CAP. Be sure to insert a protection resistor of about  $1k\Omega$  for charge and discharge when measuring the leakage current.

### 8.5 焊接注意事项 Considerations when soldering

焊接条件要在承认书的规定范围内。若没有遵守承认书的条件，则电容漏电流可能急剧增加，容量衰减。

# 固态高分子铝电解电容器

The soldering conditions are to be within the range prescribed in specifications. If the specifications are not followed, there is a possibility of the cosmetic defect, the intensive increase of leakage current, and the capacitance reduction.

不可将CAP与其它物品堆放Do not dump the CAP with objects.

## 8.6 使用CAP于工业设备 Use of CAP for industrial equipments

为确保CAP在工业设备上的可靠性，设计必须与之相符。

To ensure reliability when the CAP is used in industrial equipments, design must allow for its

## 8.10 为CAP设计电路的说明 Notes on circuit designs for CAP

### 8.10.1 执行Performance

在承认书中指定的额定性能范围内使用CAP。

Use CAP within the rating and performance ranges defined in this specifications.

### 8.10.2 使用温度和纹波电流 Operating temperature and ripple current

如果CAP的使用温度超过了上限温度（105°C）或是有过载纹波电流通过，则有较大可能使寿命缩短，或漏电流增大，造成CAP失效。

If CAP is used at a temperature higher than the upper category temperature(105°C), or excess ripple current flows through CAP, there are high possibilities of life cycle reduction or leakage current increasing to cause CAP defective.

### 8.10.3 漏电流Leakage current

漏电流会因焊接条件而有些微的上升，加载直流电压可使电容自我修复，漏电流逐渐减小。

The leakage current of CAP may increase slightly by soldering conditions. The application of DC voltage enables the capacitors to be repaired by itself and this leads the leakage current to be smaller gradually.

### 8.10.4 使用电压Applied voltage

为了保证CAP的可靠性，加载到CAP上的电压最好小于其额定电压的80%。直流加交流电压的峰值应小于额定电压。

For the reliability of CAP, it is recommended that the voltage applied to CAP should be less than 80% of the rated voltage. Peak value of the dc and ac voltage should not exceed its rated voltage.

### 8.10.5 失效模式Failure mode

CAP含有导电聚合物，其寿命的终止大部分是由于偶然失效模式，主要是短路。如果短路，CAP将因持续电流流过而过热，然后铝壳会因内部压力的增加而脱离电容。

CAP contains a conductive polymer. The life ends mostly due to random failure mode, mainly short circuit. In case of short circuit, CAP can be overheated by continuous current flow, then case of CAP would be removed by internal pressure increasing.
