DESCRIPTION

The LM431 is a three-terminal adjustable shunt regulator with specified thermal stability over applicable temperature V_{REF} (2.5V) and 40V with two external resistors. This device has a typical dynamic output impedance of 0.2Ω. Active output circuitry provides a very sharp turn-on characteristic, making this device excellent replacement for Zener diodes in many applications. The LM431 is characterized for operation from -40°C to +125°C.

(Note 1) The deviation parameters ΔV_{REF}/ΔT_A and ΔI_{REF}/ΔT_A are defined as the differences between the maximum and minimum values obtained over the recommended temperature range. The average full-range temperature coefficient of the reference voltage, αV_{REF}, is defined as:

$$|\alpha V_{REF}| \text{ (ppm/}^\circ\text{C)} = \frac{\left(\frac{V_{I(\text{dev})}}{V_{REF} \text{ at } 25^\circ\text{C}} \right) \times 10^6}{\Delta T_A}$$

Where:

ΔT_A is the recommended operating free-air temperature range of the device.

αV_{REF} can be positive or negative, depending on whether minimum V_{REF} or maximum V_{REF}, respectively, occurs at the lower temperature.

(Note 2) The dynamic impedance is defined as: $|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_{KA}}$

When the device is operating with two external resistors, the total dynamic impedance of the circuit is given by:

$$|Z'| = \frac{\Delta V}{\Delta I} \approx |Z_{KA}| (1 + R_1/R_2)$$
