DESCRIPTION

The MC34063A/B series is a monolithic control circuit delivering the main functions for DC-DC voltage converting. The device contains an internal temperature compensated reference, comparator, duty cycle controlled oscillator with an active current limit circuit driver and high current output switch.

Output voltage is adjustable through two external resistors with a 2% reference accuracy.

Employing a minimum number of external components the MC34063A/B devices series is designed for Step-Down, Step-Up and Voltage-Inverting applications.

Note 1. Maximum package power dissipation limit must be observed.

Note 2. T_{LOW}= '-30℃, T_{HIGH}= '+125℃

Note 3. If Darlington configuration is not used, care must be taken to avoid deep saturation of output switch.
The resulting switch-off time may be adversely affected.
In a Darlington configuration the following output driver condition is suggested:

Forced β of output switch : $\frac{I_{C(OUTPUT)}}{I_{C(DRIVER)} - 7.0mA^*} \geq 10$

* Currentless due to a built in 1KΩ anti-leakage resistor

TERMS AND DEFINITIONS

V_{SAT} - Saturation voltage of the output switch.

VF - Forward voltage drop of the output rectifier.

The following power supply characteristics must be chosen:

V_{IN} - Nominal input voltage.

V_{OUT} - Desired output voltage.

I_{OUT} - Desired output current.

f_{MIN}- Minimum desired output switching frequency at the selected values of V_{IN} and I_O.

$V_{RIPPLE(p-p)}$ – Desired peak-to-peak output ripple voltage. In practice the calculated capacitor value will need to be increased due to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
