

DESCRIPTION

The SN75176N used for RS-485/RS-422 communication is a 10Mbps high-speed transceiver for half duplex communication, which includes one driver Device and a receiver.

Equippedwith ± 8kV human mode ESD protection and failure protection circuit,ensuring that when the receiver input is open or short circuited Receiver output logic high level.

If all transmitters attached to the terminal matching bus are disabled (high resistance), the receiver will output logic high Level.

The SN75176N driver does not limit the swing rate and can ensure a communication rate of up to 10Mbps.

SN75176N has a receiver with 1 Unit load input impedance, up to 32 transceivers can be connected to the bus.

In addition, SN75176N also has an built-in overtemperature protection circuit to ensure the chip is not damaged under high temperature conditions.

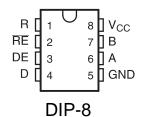

FEATURES

- Provide low current shutdown mode
- Provide industry standard 8-pin SOP packaging
- Up to 32 transceivers are allowed to be mounted on the bus
- · True fail safe receiver compatible with EIA/TIA-485
- Built in over temperature protection circuit ensures that the chip is not damaged due to High temperatures
- Provide enhanced ESD protection for RS-485/ RS-422 A/B pins

APPLICATIONS

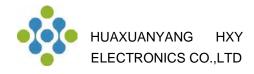

- · SCSI "Fast 40" Drivers and Receivers
- · Motor Controller/Position Encoder Systems
- Factory Automation

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

All voltage values, except differential input/output bus voltage, are with respect to network ground terminal. (2)

(3) Maximum power dissipation is a function of T_{J(max)}, θ_{JA}, and T_A. The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(max) - T_A) / \theta_{JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability. The package thermal impedance is calculated in accordance with JESD 51-7.

(1) The power-off measurement in ANSI Standard TIA/EIA-422-B applies to disabled outputs only and is not applied to combined inputs and outputs.

All typical values are at V_{CC} = 5 V and T_A = 25°C. (2)

(4) The minimum V_{OD2} with a 100-Ω load is either 1/2 V_{OD1} or 2 V, whichever is greater.
 (4) See ANSI Standard TIA/EIA-485-A, Figure 3.5, Test Termination Measurement 2.

[VOD] and [VOC] are the changes in magnitude of VOD and VOC, respectively, that occur when the input is changed from a high level (5) to a low level.

This applies for both power on and off; refer to ANSI Standard TIA/EIA-485-A for exact conditions. The TIA/EIA-422-B limit does not (6) apply for a combined driver and receiver terminal.
