2.2、Pin Configurations

2.3、Pin Description

| Pin No. | Pin Name | Description |
|---------|----------|--|
| 1 | COMP | This pin is the Error Amplifier output and is made available for loop compensation. |
| 2 | VFB | This is the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider. |
| 3 | ISENSE | A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction. |
| 4 | RT/CT | The oscillator frequency and maximum Output duty cycle are programmed by connecting resistor RT to VREF and capacitor CT to ground. Operation to 500kHz is possible. |
| 5 | GROUND | This pin is the combined control circuitry and power ground. |
| 6 | OUTPUT | This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin. |
| 7 | Vi | This pin is the positive supply of the control IC. |
| 8 | VREF | This is the reference output. It provides charging current for capacitor CT through resistor RT |

Notes:

1. Max package power dissipation limits must be respected; low duty cycle pulse techniques are used during test maintain T_j as close to T_{amb} as possible.
2. These parameters, although guaranteed, are not 100% tested in production.
3. Parameter measured at trip point of latch with $V_{PIN2}=0$.
4. Gain defined as : $A=\Delta V_{PIN1}/\Delta V_{PIN3}; 0 \leq V_{PIN3} \leq 0.8V$
5. Adjust V_i above the start threshold before setting at 15V.
