## Description

The BGSA143ML10 is a versatile Single-Pole Quad Throw (SP4T) RF antenna tuning switch featuring open or short to ground reflective OFF ports, being optimized for tuning applications up to 6.0 GHz. Including a RFFE digital control interface, this switch offers the possibility to adopt a SP4T, SP3T, SPDT along with SPST topology for a better flexibility in RF Front-End designs.

The BGSA143ML10 includes 4 ultra-low  $R_{on}$  series ports and 4 individually switchable shunt switches to enable open reflective and short-reflective behavior. As a result any type of antenna tuning switching or tuner circuits can be realized. Unlike GaAs technology, the 0.1 dB compression point exceeds the switch maximum input power level, resulting in linear performance at all signal levels and external DC blocking capacitors at the RF ports are only required if DC voltage is applied externally. Due to its high RF voltage ruggedness, it is suited for switching any reactive devices such as inductors and capacitors in RF matching circuits without significant losses in quality factors.

<sup>1)</sup> Switch has a low-pass response. For higher frequencies, losses have to be considered for their impact on thermal heating. The DC voltage at RF ports  $V_{RFDC}$  has to be 0V.

<sup>2)</sup> Note: Consider any ripple voltages on top of  $V_{IO}$ . A high RF ripple at the  $V_{IO}$  can exceed the maximum ratings by  $V_{IO} = V_{DC} + V_{Ripple}$ .

<sup>3)</sup> Field-Induced Charged-Device Model ANSI/ESDA/JEDEC JS-002 Simulates charging/discharging events that occur in production equipment and processes. Potential for CDM ESD events occurs whenever there is metal-to-metal contact in manufacturing.

<sup>4)</sup> Human Body Model ANSI/ESDA/JEDEC JS-001 ( $R = 1,5\ \text{k}\Omega$ ,  $C = 100\ \text{pF}$ ).

<sup>5)</sup> IEC 61000-4-2 ( $R = 330\ \Omega$ ,  $C = 150\ \text{pF}$ ), contact discharge.

**Warning: Stresses above the max. values listed here may cause permanent damage to the device. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit. Exposure to conditions at or below absolute maximum rating but above the specified maximum operation conditions may affect device reliability and life time. Functionality of the device might not be given under these conditions.**

**Important Note:** Infineon’s SCLK/SDATA swap mode requires a “clean” MIPI RFFE clock signal to trigger a proper communication between SCLK RFFE Master device and BGSA143ML10. To guarantee “clean” MIPI RFFE clock signal reaching BGSA143ML10 digital input, SCLK line must have a pull-down resistor to ground. In case the RFFE Master does not provide an internal pull-down, Infineon recommends to add a 100kohm resistor pull-down to ground on the RFFE Master SCLK driver output line.

Mapping of Switch Rows to Bit: ON = 1 OFF = 0

**BGSA143ML10 truth table allows to connect any combination of above bits in one single register\_0 (respectively register\_1) write command. As an example RF1 series can be set ON while RF1 shunt is set OFF, RF2, RF3 and RF4 series set OFF and shunt set ON by using this single register\_0 write command «0b:11100001».**
