1. Evaluation Board Overview

There are 2 banana jacks, 4 LEDs, one wake up button, one connector for the uIO and a set of headers for jumper configurations on the evaluation board. The functionality behind these components is explained in the following chapters. The distribution of these elements on the board can be observed in the figure below:

Figure 1: Board overview

2. Banana Jacks

The SBC is usually supplied through the **VBAT** (X6, typ 13.5 V) and **GND** (X9) banana jacks (alternatively see Chapter 6.1 to supply it with the uIO stick).

The **VCC1** (X11, 5 V or 3.3 V, depending on the SBC's version) and **VCC2** (X11, 5 V) screw terminals provide the regulated output voltages of the SBC. The voltages **VCC1** and **VCC2** are simultaneously used to support signal LEDs at the output clamps.

The charge pump stage of the SBC drives two MOSFETS at the evalboard. One to protect SW against reverse polarity, the other is used as a VBAT power switch, supporting the SW (X7) terminal.

3. Buttons

The wake up button (WK) wakes up the SBC (from Sleep and/or Fail Safe Mode), if the corresponding jumpers are properly configured (see Chapter 6.4 for more information).

4. LED's

The **LED FO** (D8) and **LED GPIO** (D7) indicate the voltage level of the FO/GPIO pins, if the corresponding jumpers are properly configured (see Chapter 6.4 for more information).

The **VCC1 LED** (D1) lights, if VCC1 is enabled and the **VCC2 LED** (D5), if VCC2 is enabled, if the corresponding jumpers are connected (see Chapter 6.3 for more information). Only one LED (**LED FO** or **LED GPIO**) can be used at a time.

5. Connectors

5.1. μ I/O Connector

The μ I/O Connector corresponds to the X14 on the board. The pin distribution of the connector is shown in the following figure:

Figure 2: X14 μ I/O connector

The functionality of the X14's pins is detailed in the following table:

Pin	Functionality	Pin	Functionality
1	NC	2	GND
3	NC	4	NC
5	NC	6	VS_UIO
7	NC	8	INTN
9	CSN	10	NC
11	CLK	12	FO_UC
13	SDO	14	RSTN
15	SDI	16	ADC_UIO

Table 1: Pins of the μ I/O connector

6. Jumper Configurations

6.1. Power Supply Configuration

The SBC can be supplied with VBAT (typical use case) or through the 12V provided by the uIO (if plugged in and connected to a USB port). This can be configured with the jumper X10, located close to the reset button:

Figure 3: Jumper to configure the SBC's power supply

The possible configurations are as follows:

	X10
SBC supplied through Vbat (12 V)	Connect VBAT
SBC supplied through uIO (12 V)	Connect VSUP and VS_UIO

Table 2: X10 Configuration

6.2. General Configuration: INTN and TEST pins

These jumpers are located at the left side of the board:

Figure 4: Jumpers for SBC configuration purposes

The jumper X24 allows to select the hardware configuration of the SBC (configuration 1/3 or 2/4):

	X24
Config 1/3	Connect INTN and Vcc1
Config 2/4	Leave open

Table 3: X24 Configuration

Through the jumper X27 the operation mode of the SBC can be selected:

	X27
Development Mode	Connect Vcc1 and TEST (<i>no need to start watchdog</i>)
User Mode	Leave open

Table 4: X27 Configuration

6.3. Jumpers to connect/disconnect the VCCx LEDs

These jumpers are located at the left bottom of the board:

Figure 5: Jumpers for the Vccx LEDs

If X13 is connected and VCC2 is enabled, the VCC2 LED (D5) shines. In the same manner, if X8 is connected and VCC1 is enabled, the VCC1 LED (D1) shines.

6.4. Configuration of the WK/VSENSE and FO/GPIO pins

These jumpers are located at the top right corner of the board:

Figure 6: Jumpers related to the WK/VSENSE and FO/GPIO pins

The possible configurations are shown in the following table. Note, that these are the only possible configurations due to the fact that functionalities are multiplexed:

	X26: FAIL OUTPUT	X16: WAKE SOURCE	X17: WAKE / VSENSE SELECT	X19: FO/GPIO LED
V_s Sense	Connect Pin 2+3	Open	Connect Pin 2+3	Open
Cyclic Sense	Open	Connect Pin 2+3	Connect Pin 1+2	Open
Regular wake up (wake up through wake up button)	Open	Connect Pin 1+2	Connect Pin 1+2	Open
GPIO as HS (LED D7 as load)	Open	Open	Open	Closed
FO (LED D8)	Connect Pin 1+2	Open	Open	Open
Regular wake up and FO	Connect Pin 1+2	Connect Pin 1+2	Connect Pin 1+2	Open
Regular wake up and GPIO as HS	Open	Connect Pin 1+2	Connect Pin 1+2	Closed

Table 5: Configurations related to the WK/VSENSE and FO/GPIO pins

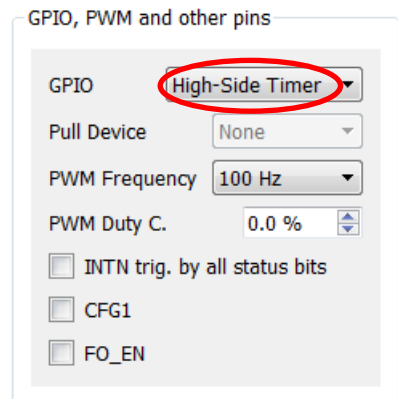

V_s Sense:

For the voltage sensing, check the “Voltage Sensing” button in the config wizard.

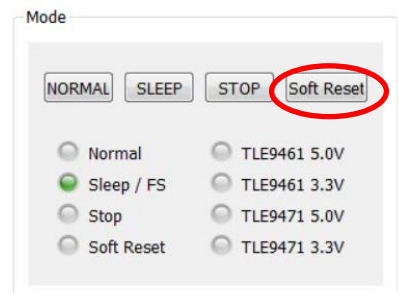

Cyclic Sense:

For the cyclic sensing, choose “High-Side Timer” from the drop-down menu at GPIO.

Regular wake-up:

For the regular wake-up, press the “Soft Reset” button in the Mode section.

GPIO as HS (LED D7 as load):

For GPIO as HS switch, choose High-Side PWM in the GPIO field and chose the PWM Duty Cycle.

FO (LED D8):

For the failure output, choose “Failure Output” from the drop-down menu at GPIO.

6.5. CAN connector

The connector for CANH and CANL is X23. The CAN terminations are fixed.

Figure 7: Jumper for the CAN terminations

For proper termination of the CAN bus, two 62Ω resistors are connected in series, differentially between CANH and CANL. In addition, there is a 4.7nF capacitor supporting bus-symmetry during data-transmission.

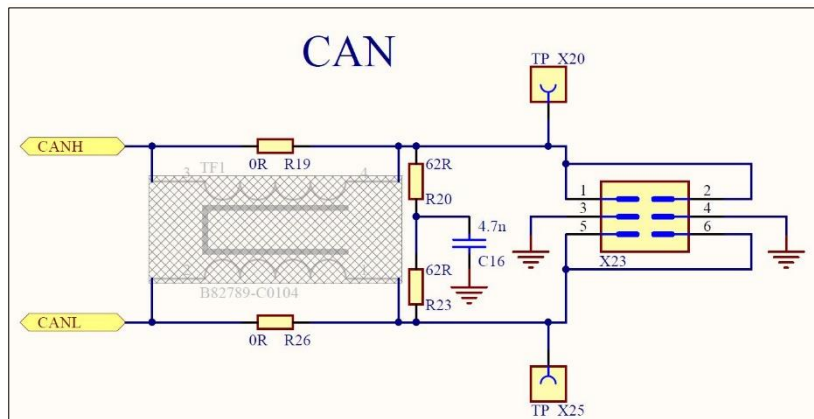

Figure 8: CAN termination

In case, a Common Mode Choke (CMC) is considered to further improve electromagnetic compatibility / immunity, a landing pattern is designated, either using R19 and R26 or replacing it with the CMC.

7 Charge Pump

The internal charge pump provides a gate control voltage for VBAT connected NMOS transistors. This allows the smart control of a reverse polarity protection circuit and or a VBATpower switch.

As a switched power connection example, a DC Motor can be connected to the TLE9461 / TLE9471 board through the SW and GND (X7) pins as shown in Figure 10:

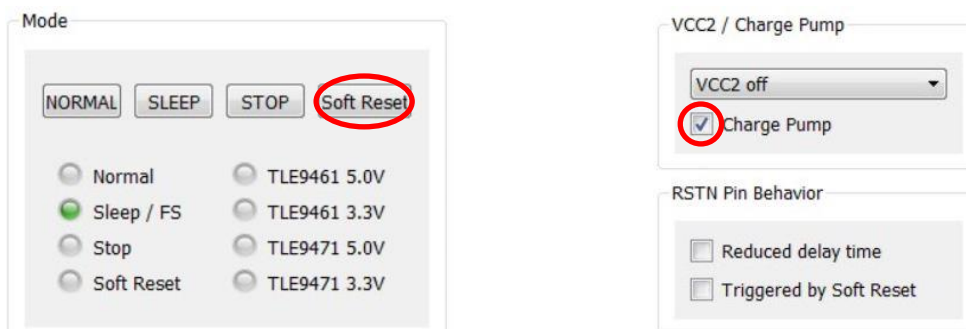

Figure 10: DC Motor connection to the board

In order to start the motor, press the “Soft Reset” button and check the “Charge Pump” box in the Config Wizard.

Note: For more information, please check chapter 14 in the datasheet.

8 Layout and Materials Details

In the following table, all the devices used on the board (BOM) are described in detail:

Item	Value	Package Reference	Manufacturer	Part Number

10 Additional Information

For testing the TLE9461-3ES / TLE9471-3ES Evaluation Board, the Infineon Toolbox needs to be downloaded. It can be found at: <https://www.infineon.com/Toolbox>

Inside *Infineon Toolbox*, go to "Manage tools" and search for "Config Wizard for SBC". The *Config Wizard* is a powerful user interface that allows to control the SBC, including full register access.

The connection between computer and evaluation board is supported by the μ IO stick. A short video tutorial how to setup the board can be found at www.infineon.com/sbc (Lite SBC family).

For further information please contact <http://www.infineon.com> or your regional FAE.

LEGAL DISCLAIMER

THE INFORMATION GIVEN IN THIS APPLICATION NOTE IS GIVEN AS A HINT FOR THE IMPLEMENTATION OF THE INFINEON TECHNOLOGIES COMPONENT ONLY AND SHALL NOT BE REGARDED AS ANY DESCRIPTION OR WARRANTY OF A CERTAIN FUNCTIONALITY, CONDITION OR QUALITY OF THE INFINEON TECHNOLOGIES COMPONENT. THE RECIPIENT OF THIS APPLICATION NOTE MUST VERIFY ANY FUNCTION DESCRIBED HEREIN IN THE REAL APPLICATION. INFINEON TECHNOLOGIES HEREBY DISCLAIMS ANY AND ALL WARRANTIES AND LIABILITIES OF ANY KIND (INCLUDING WITHOUT LIMITATION WARRANTIES OF NON-INFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS OF ANY THIRD PARTY) WITH RESPECT TO ANY AND ALL INFORMATION GIVEN IN THIS APPLICATION NOTE.

Information

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
