

Boost to battery evaluation kit

TLD5099EP

About this document

Product description

The TLD5099EP is an AEC qualified DC/DC boost controller, especially designed to drive LEDs.

- Built in diagnosis and protection features
- Pulse width modulator to implement a dimming function with reduced color shifting
- Spread spectrum modulator to improve the EMI performance

Scope and purpose

Scope of this user manual is to provide to the audience instructions on usage of TLD5099EP boost to battery evaluation board.

Intended audience

This document is intended for engineers who need to perform measurements and check performances with TLD5099EP boost to battery evaluation board.

1 Description

1 Description

Evaluation board for high power LED application with TLD5099EP product in boost to battery topology. Default configuration of the board is boost to battery topology without any additional features enabled. In this configuration, it can deliver up to 21 W to the load with an efficiency above 84%. Auxiliary circuits to protect the DC/DC and the load during short to ground are present.

The board is also equipped with the following features, enabled by jumpers:

- Output current adjustment trimmer
- Power derating circuitry
- Embedded PWM engine
- Cold Crank Survival Circuit (**CCSC**)

Figure 1 Board picture

1 Description

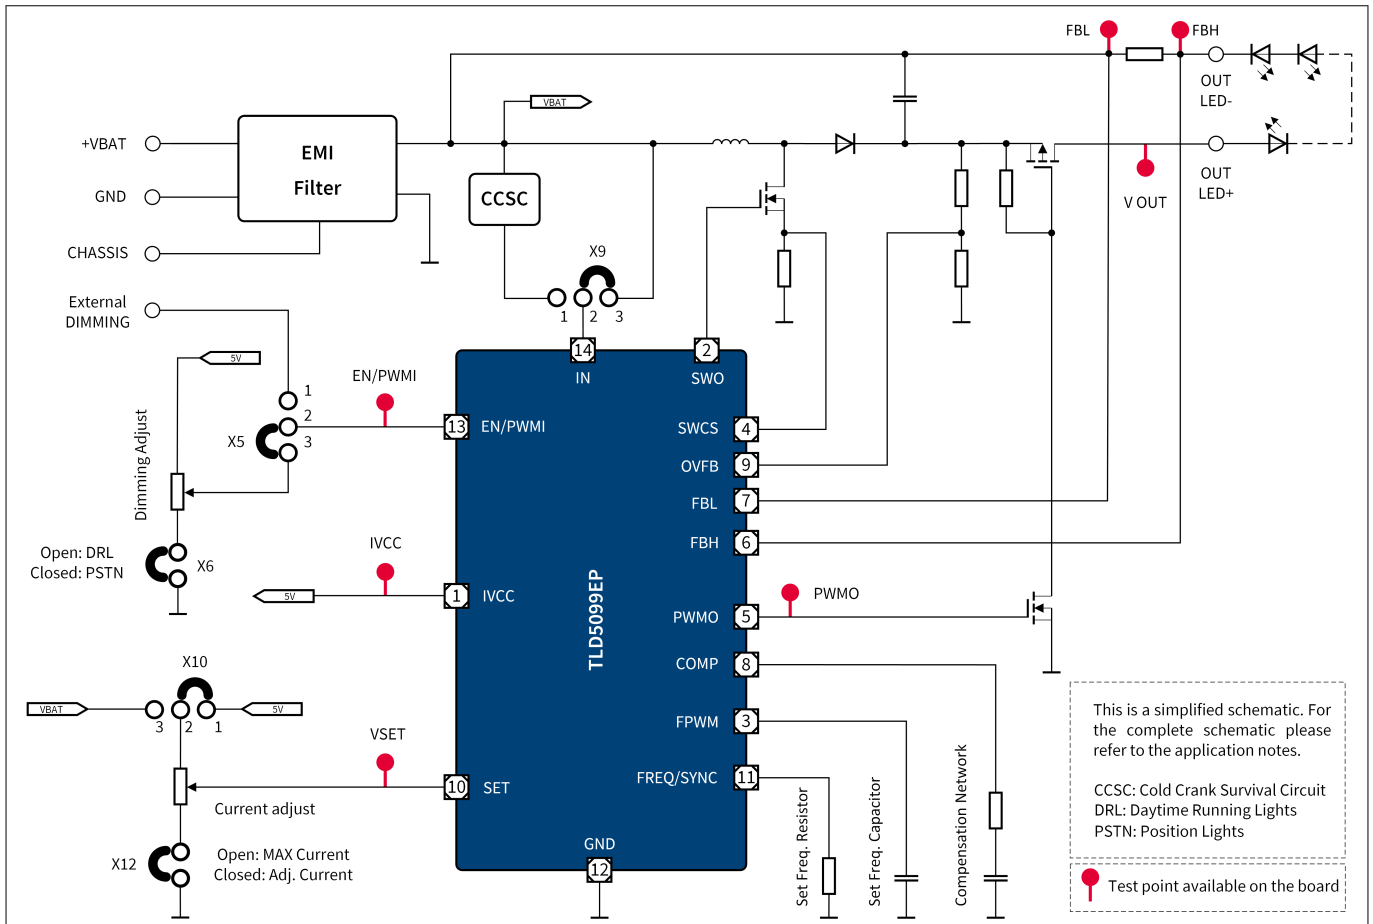

Figure 2 Simplified schematic

Table 1 Performance summary

Parameter	Conditions	Value
Input supply voltage	Jumper X9 in position 2-3 (CCSC deactivated) Parameter degradation below 6.5 V	8 V to 27 V Down to 6.5 V for less than 2 s
Input supply voltage	Jumper X9 in position 1-2 (CCSC active)	8 V to 27 V Down to 3.0 V for less than 2 s
Output current	Jumper X12 open	1 A
Switching frequency	$V_{IN} = 13.2 \text{ V}$; spread spectrum "on"	400 kHz
Efficiency	Measured with 7 white standard LED 3 V @ 1 A output current	> 84%
Output voltage range	Output voltage related to positive input	6 V to 23 V
Output overvoltage protection	Output voltage related to ground	59 V

2 Quick start procedure

2 Quick start procedure

The default configuration of the board has all additional features disabled. Jumpers are populated as follows:

Table 2 Jumper population

Jumper number	Conditions	Meaning
X9	Close 2-3	Disable CCSC
X5	Close 2-1	External dimming enabled
X10	Close 2-1	Disable battery dependent current

The default configuration is depicted below:

Figure 3 Default configuration of the board

In this configuration, PWM signal has to be applied as digital signal on X18 (max 45 V), and the output current cannot be adjusted.

3 Current adjustment

3 Current adjustment

Output current adjustment can be performed by changing the value of trimmer R15 with a screwdriver, when X10 is closed in position 1-2 and X12 is closed. Output current can vary from 0 to 100% of the maximum output current (in this demoboard from 0 to 1 A). By removing the X12 jumper, output current will reach its maximum value.

Jumpers are populated as follows:

Table 3 Jumper population

Jumper number	Condition	Meaning
X9	Close 2-3	Disable CCSC
X5	Close 2-1	External dimming enabled
X10	Close 2-1	Disable battery dependent current
X12	Closed	Adjustable output current enabled

Figure 4 Current adjustment

4 Power derating (Battery dependent current)

4 Power derating (Battery dependent current)

Power derating acts by reducing V_{SET} (and thus the output current) when the battery voltage drops below 8 V. It works better when R15 is trimmed to its maximum value, otherwise a different derating profile is applied. If a different derating profile is needed, R14 has to be changed accordingly, in order to have 1.6 V on pin SET when the battery voltage reach the desired threshold below which the output current must decrease proportionally. A quick formula to calculate R14 is:

$$R14 = (R15 + R18) \cdot \left(\frac{V_{BATT}}{1.6} - 1 \right)$$

where $R15 = 10\text{ k}\Omega$ and $R18 = 560\ \Omega$.

For example, if the power derating should start when the battery voltage drops under 12 V, R14 must be replaced with a 68 k Ω 0603 resistor (please refer to the TLD5099EP datasheets for more information).

Jumpers are populated as follows:

Table 4 Jumper population

Jumper number	Condition
X9	Close 2-3
X5	Close 2-1
X10	Close 2-3
X12	Closed

Figure 5 Power derating

5 Embedded PWM engine

5 Embedded PWM engine

Embedded PWM engine provides an internal PWM signal without any external dimming signal required. It is enabled when X5 is closed in position 2-3. If X6 is open, EN/PWMI/PWMA pin is biased at 5 V and then the duty cycle is 100%; closing X6, the duty cycle is adjustable by means of trimmer R4. The PWM frequency is set to 350 Hz; if another PWM frequency is needed, C28 must be changed to a proper value (please refer to the TLD5099EP datasheets for more information).

Jumpers are populated as follows:

Table 5 Jumper population

Jumper number	Condition	Meaning
X9	Close 2-3	Disable CCSC
X5	Close 2-3	Internal dimming enabled
X10	Close 2-1	Disable battery dependent current
X6	Closed	Adjustable PWM dimming for position light

Figure 6 Embedded PWM engine

6 Cold crank survival circuit

6 Cold crank survival circuit

This feature helps the system to survive the LV124 test E11 “severe test pulse”, when input voltage drops below 4.5 V that is the minimum input voltage for the TLD5099EP. This circuit feeds back the device with the output voltage when the input voltage drops. To activate this feature, close X9 in position 1-2. Other settings can be left as preferred.

Warning: *The CCSC uses a Zener diode to adapt the output voltage to the required voltage for the TLD5099EP, so that it can derate the efficiency performance.*

10 Efficiency measurements

10 Efficiency measurements

Figure 13 Efficiency vs. input voltage

This efficiency performance has been obtained with:

Table 7 Parameters influencing efficiency

Output load:	Series of 7 white standard LED with $V_j = 3\text{ V}$ kept cooled with forced air
EMI filter:	Totally bypassed by closing the jumpers X1, X14 and X16
CCSC:	Off (jumper X9 closed on 2-3)
Current adjustment:	Off (jumper X12 left open)
Dimming output:	Off (jumper X6 left open)
Power derating:	Off (jumper X10 closed on 1-2)

Efficiency performances can be increased: refer to [Chapter 11](#).

11 Maximizing efficiency

11 Maximizing efficiency

This evaluation board has been designed to reach a fair compromise between efficiency performance and EMI emissions compliance.

Nevertheless, if the maximum efficiency is needed, the following actions should be considered:

- 1.** Remove the snubber circuit R5, C25 or choose a lower value for the capacitor C25 (for example 470 pF)
- 2.** Bypass the whole EMI filter, by bridging the jumpers X1, X14 and X16
- 3.** Bypass the output ferrite beads L3 and L5
- 4.** Replace the main inductor L6 with one that boasts a lower parasitic DC resistance, for example
 - Vishay IHLP6767GZER470M8A
 - Bourns SRP1770TA-470M
- 5.** Turn off the CCSC by placing the jumper X9 on position 2-3

12 Minimizing EMI emissions

12 Minimizing EMI emissions

This evaluation board has been designed to reach a fair compromise between efficiency performance and EMI emissions compliance. Furthermore, this evaluation board can fulfill the class V of the CISPR25 in conducted emissions from 150 kHz to 108 MHz.

Nevertheless, if the minimum EMI emission is required, the following actions should be considered:

1. Choose a higher value for the capacitor C25 (for example 2.2 nF)
2. Include the whole EMI filter, by removing bridges from the jumpers X1, X14 and X16.
3. Replace the 0 Ω resistor R8 with a small value like 10 Ω or 22 Ω
4. Replace the main inductor L6 with a shielded one (for example the Cynotec VCHE106G-470MS6) and connecting to ground the shield
5. With a short piece of wire connect the CHASSIS TERMINAL to the test ground plane as close as possible to where the board is placed
